Impaction and Extraction Facts

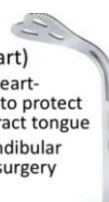

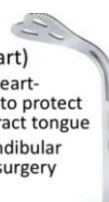

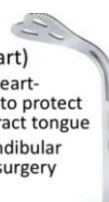

Indications for Exo	<ul style="list-style-type: none"> - Caries - Endo - Perio - Ortho - Cracked Tooth - Supernumerary - Pathology - Questionable teeth before Radiation
Contraindications (relative)	<ul style="list-style-type: none"> - Poorly controlled Diabetes - End Stage Renal Disease - Unstable Angina - Leukemia and Lymphoma - Hemophilia or Platelet disorders - Hx of Head and Neck Radiation <ul style="list-style-type: none"> - Hyperbaric Oxygen Before + After Exo - IV Bisphosphonates - Pericoronitis (Tx infection 1st)

Impacted Teeth	<p>= Fail to erupt into the dental arch within the expected time</p> <ul style="list-style-type: none"> - Mandibular 3rd Molars > Maxillary 3rd Molars > Maxillary Canines <p>Primary Etiology: -> Inadequate arch length</p>	
Congenitally Missing Teeth	<p>= Teeth that have failed to form</p> <p>3rd Molars (8) > Max Lateral (U2) > Mand 2nd Premolar (L5)</p>	
Complications of Extractions		
Subperiosteal Abscess	<p>= result of nidus of infection trapped under the periosteum layer (small pieces of bone or tooth left under a flap after surgical exo)</p> <ul style="list-style-type: none"> - Possible whenever a flap is elevated - Irrigate thoroughly to ensure nothing is left behind! 	
Oro-Antral Communication (OAC)	<p>= Most common with Max. 1st molars (Palatal Root)</p> <ul style="list-style-type: none"> - Prevent w/ good pre-op radiograph and avoid excessive apical pressure <p>Tx:</p> <ul style="list-style-type: none"> - If <2mm = Do nothing , Sinus precautions - If 2-6mm = 4As and figure 8 suture <ul style="list-style-type: none"> - Antibiotics - Analgesics - Antihistamines - Afrin Nasal Spray 2x per day - If >6mm flap surgery 	
Alveolar Osteitis (Dry Socket)	<p>= Occurs when blood clot dislodges or dissolves before wound heals following exo</p> <ul style="list-style-type: none"> - NOT and infection, no antibiotics required <p>Tx: Irrigate and local pain control</p> <ul style="list-style-type: none"> - Pack in Alveogel! -> Eugenol helps with pain 	
Nerve Injury	<p>= Most common with Lower 3rd molars (IAN nerve proximity)</p> <p>Tx: Medrol Dosepak</p> <ul style="list-style-type: none"> - Methylprednisolone -> Steroid to ↓ inflammation - Numbness lasting >4 weeks = referral to micro-neurosurgeon for evaluation 	
Tooth Displacement	<p>Maxillary 1st/2nd molar = Maxillary Sinus Maxillary 3rd molar = Infratemporal fossa Mandibular 3rd molar = Submandibular space</p> <p>If tooth is lost into the oropharynx -> send to ER for Chest and abdominal x-rays</p>	

Classifications of Impaction

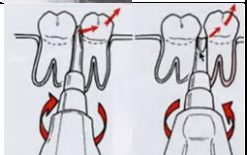

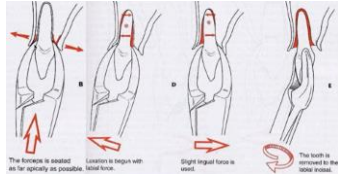

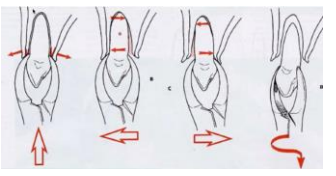

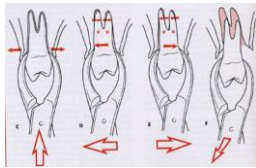

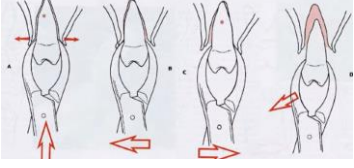

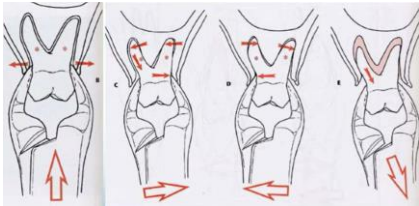

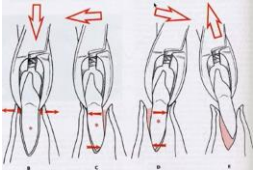

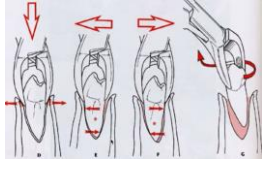

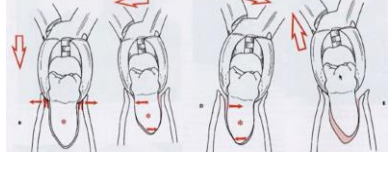

Nature of Overlying Tissue	<p><u>Soft Tissue Impaction</u>: Height of Contour is above the bone and gingiva is completely or partially covering the tooth</p> <ul style="list-style-type: none"> - Easiest <p><u>Hard Tissue Impaction</u>:</p> <ul style="list-style-type: none"> - Partial Bony = Height of contour is below the bone level - Full Bony = Tooth is entirely encased in bone (most difficult) 												
Winters Classification	<p>= For only 3rd molars</p> <ul style="list-style-type: none"> - Based on the position of the long axis of the 3rd molar in relation to the 2nd molar <p>Mandibular (Mama Has Violet Daisies):</p> <ul style="list-style-type: none"> - Mesioangular = Easiest - Horizontal = 2nd easiest - Vertical = 2nd hardest - Distoangular = most difficult 												
Pell and Gregory	<p>= Only for Lower 3rd molars</p> <table border="1" data-bbox="446 619 1518 829"> <tr> <td>Class A</td><td>Same plane as other molars</td></tr> <tr> <td>Class B</td><td>Halfway down other molars</td></tr> <tr> <td>Class C</td><td>Below cervical line of 2nd molar -> Most difficult</td></tr> </table> <table border="1" data-bbox="446 735 1518 829"> <tr> <td>Class I</td><td>Crown anterior to ramus</td></tr> <tr> <td>Class II</td><td>Crown ½ into ramus</td></tr> <tr> <td>Class III</td><td>Crown completely in the ramus -> Most difficult</td></tr> </table> 	Class A	Same plane as other molars	Class B	Halfway down other molars	Class C	Below cervical line of 2 nd molar -> Most difficult	Class I	Crown anterior to ramus	Class II	Crown ½ into ramus	Class III	Crown completely in the ramus -> Most difficult
Class A	Same plane as other molars												
Class B	Halfway down other molars												
Class C	Below cervical line of 2 nd molar -> Most difficult												
Class I	Crown anterior to ramus												
Class II	Crown ½ into ramus												
Class III	Crown completely in the ramus -> Most difficult												

Instrumentation for Extractions

Bite Blocks	Soft rubber block for patient to bite down on <ul style="list-style-type: none">- Used to keep mouth open and ↑ Visualization- Stabilizes mandible during exo (good for the TMJ) 				
Suction Tips	<u>Yankauer Suction</u> = Better for soft tissue (gentler) <ul style="list-style-type: none">- The plastic piece <u>Frazier suction</u> = Good for hard and soft tissue <ul style="list-style-type: none">- Can cover or uncover a hole on the tip to ↑ or ↓ the suction pressure 				
Towel Clip	Hold drapes placed around the patient <ul style="list-style-type: none">- Locking handle w/ finger and thumb ring- Careful not to pinch the patients skin! 				
Tissue Retractors	<table><tr><td><ul style="list-style-type: none">• Austin<ul style="list-style-type: none">- Right angle- For small flaps</td><td><ul style="list-style-type: none">• Weider (Sweetheart)<ul style="list-style-type: none">- Broad heart-shaped to protect and retract tongue- For mandibular lingual surgery</td><td><ul style="list-style-type: none">• Minnesota<ul style="list-style-type: none">- Offset curved and broad- For cheek/flap</td><td><ul style="list-style-type: none">• Seldin<ul style="list-style-type: none">- Long and flat- For elevating down to floor of mouth as in mandibular tori removal</td></tr></table>	<ul style="list-style-type: none">• Austin<ul style="list-style-type: none">- Right angle- For small flaps 	<ul style="list-style-type: none">• Weider (Sweetheart)<ul style="list-style-type: none">- Broad heart-shaped to protect and retract tongue- For mandibular lingual surgery 	<ul style="list-style-type: none">• Minnesota<ul style="list-style-type: none">- Offset curved and broad- For cheek/flap 	<ul style="list-style-type: none">• Seldin<ul style="list-style-type: none">- Long and flat- For elevating down to floor of mouth as in mandibular tori removal 
<ul style="list-style-type: none">• Austin<ul style="list-style-type: none">- Right angle- For small flaps 	<ul style="list-style-type: none">• Weider (Sweetheart)<ul style="list-style-type: none">- Broad heart-shaped to protect and retract tongue- For mandibular lingual surgery 	<ul style="list-style-type: none">• Minnesota<ul style="list-style-type: none">- Offset curved and broad- For cheek/flap 	<ul style="list-style-type: none">• Seldin<ul style="list-style-type: none">- Long and flat- For elevating down to floor of mouth as in mandibular tori removal 		
Periosteal Elevator	<u>Woodson Periosteal</u> = Small and delicate <u>#9 Molt Periosteal</u> = larger elevator 				

Straight Elevator	<ul style="list-style-type: none">• Straight Elevator (#301)<ul style="list-style-type: none">– Most commonly used– Lever– Blade has concave surface towards the tooth to be elevated• Triangular Elevator (Cryer)<ul style="list-style-type: none">– Second most commonly used– Wheel & axle– Left and right pairs– Removing a broken root left in the socket• Pick Elevator<ul style="list-style-type: none">– Remove retained or broken root– Wedge– Crane pick is heavy version– Root tip pick is delicate version
Extraction Forceps	<div><p>Maxillary</p><p>#150 (Universal)</p><ul style="list-style-type: none">- A= Premolars- S=Primary Teeth<p>#88R/L (Upper Cowhorn)</p><ul style="list-style-type: none">- 2 Beaks -> Surround palatal root- 1 Beak -> Engages the buccal bifurcation<p>#65 – Upper root forceps</p></div> <div><p>Mandibular</p><p>#151 (Universal)</p><ul style="list-style-type: none">- A = Premolar- S = Primary Teeth<p>#23 (Cowhorn)</p><ul style="list-style-type: none">- Lower Molars- Beaks engage the bifurcation of the lower molar<p>#74 (Ash)</p><ul style="list-style-type: none">- Mandibular Premolars</div>
Blades	<div><p>#15</p><p>– Most common for intraoral surgery</p></div> <div><p>#10</p><p>– Large skin incisions</p></div> <div><p>#11</p><p>– Stab incisions</p></div> <div><p>#12</p><p>– Mucogingival surgery</p><p>– Curved shape enhances ease of access to the sulcus</p></div>
Irrigation	= Use steady stream of sterile saline/water during bone removal <ul style="list-style-type: none">- Prevents heat generation (may devitalize bone)- ↑ efficiency of bur
Curettes	= Spoon-shaped end for scraping away soft tissue <ul style="list-style-type: none">- Always curette a socket!
Bone Removers	<div><p>Rongeurs</p><ul style="list-style-type: none">– Double spring pliers– Trim interradicular bone</div> <div><p>Bone File</p><ul style="list-style-type: none">– For final smoothing before suturing– Removes bone with pull stroke</div> <div><p>Osteotome (Bone Chisel)</p><ul style="list-style-type: none">– Flat end tapped with surgical mallet– Monobevel → remove torus– Bibevel → section teeth</div> <div><p>Surgical Handpiece</p><ul style="list-style-type: none">– Do NOT use air-driven handpiece– Straight fissure burs → section teeth– Round burs → remove bone<p>-> Air driven will lead to Air Emphysema!</p></div>
Hemostat	= Designed for hemostasis -> Clamp blood vessels closed before suture and cauterizing <ul style="list-style-type: none">- Useful also for blunt dissection of soft tissue was as in I&D- Curved or straight beaks- Serrated end allows for tissue grasping
Needle Driver	<ul style="list-style-type: none">- Short stout beaks (compared to hemostat)- Face of beak is crosshatched (Vs hemostat) -> Allows for better grasp of needle
Suture	= Needle + Thread <ul style="list-style-type: none">- Primary purpose is to immobilize a flap- Place from movable tissue to non-movable tissue (Flap First -> then bound tissue on other side)- Simple interrupted is the easiest and most common technique- Silk has wicking property -> allows bacteria to invade
Forceps	<div><p>Adson Tissue Forceps</p><ul style="list-style-type: none">– Toothed → periosteum, muscle, aponeurosis– Non-toothed → fascia, mucosa, pathological tissue for biopsy</div> <div><p>Utility Forceps</p><ul style="list-style-type: none">– Used for picking up items from tray or preparing packing materials– NOT for handling soft tissues</div>
Scissors	<p>Dean</p> <ul style="list-style-type: none">- Used for cutting sutures- Blades angles up for easier access to suture thread <p>Mayo</p> <ul style="list-style-type: none">- For cutting fascia and dissecting soft tissue

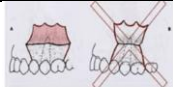

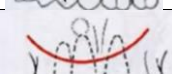

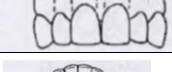

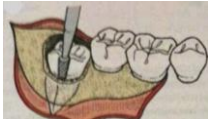

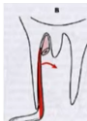

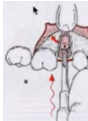

Simple Extraction

Preparation for Extraction	<p>**Check that you are removing the correct tooth!**</p> <ul style="list-style-type: none"> - Check tooth condition (Deep caries, adjacent crown or resto etc) - Check Radiograph (Pan or PA) -> Radiographs are absolutely necessary - Informed consent -> don't get sued - Comfortable positioning - Profound anesthesia - Throat screen (Malampati score)
1. Sever Soft tissue attachment	<p>Using a Periosteal elevator -> loosen gingival fibers and PDL attached to the tooth</p> <ul style="list-style-type: none"> - Confirms good anesthesia - Allows apical placement of forceps 
2. Luxate tooth with elevator	<ul style="list-style-type: none"> - Face of the blade against the tooth to be extracted - Back of the blade (the rounded part) against the alveolar crest - Find a purchase point - <u>Lever</u> -> fulcrum is the alveolar bone, not 100% on the adjacent tooth = Expansion of bone and tearing of the PDL 
3. Deliver tooth with forceps	<ul style="list-style-type: none"> - Slow and deliberate force -> tooth should first be moved, then removed <p><u>Outward (Buccal/Labial)</u> -> initial movement for most permanent teeth</p> <p><u>Inward (Lingual/Palatal)</u> -> Initial movement for most primary teeth</p> <p><u>Rotation</u> -> Initial movement for conical-rooted teeth</p> <p><u>Apical</u> -> Applied always, avoid excess pressure in max molars though (risk OAC with Max 1st molars)</p> <div style="display: flex; justify-content: space-around;"> <div data-bbox="532 825 867 1024"> <p>Upper Centrals</p>  </div> <div data-bbox="1036 825 1370 1024"> <p>Upper Canines</p>  </div> </div> <div style="display: flex; justify-content: space-around;"> <div data-bbox="509 1031 906 1289"> <p>Upper 1st Premolar</p> <ul style="list-style-type: none"> - (Caution with the deep bifurcation) - No rotation!  </div> <div data-bbox="1019 1031 1370 1289"> <p>Upper 2nd Premolar</p>  </div> </div> <p>Upper Molars</p> <ul style="list-style-type: none"> - Favor buccal pressure (Palatal may push palatal root into the sinus)  <hr/> <div style="display: flex; justify-content: space-around;"> <div data-bbox="464 1640 717 1864"> <p>Lower Incisors and Canines</p>  </div> <div data-bbox="781 1640 1040 1864"> <p>Lower Premolars</p>  </div> <div data-bbox="1105 1640 1490 1864"> <p>Lower Molars</p>  </div> </div>
4. Post Extraction	<ul style="list-style-type: none"> - Bend the B-L plates back in place (unless ortho and implants are planned in the future) - Curettage - Smooth the bone with bone file or rongeur - Irrigate with Syringe

Surgical Extraction

- Involves access through mucoperiosteal flap
- If a surgical handpiece is used (remove bone or section the teeth) = Surgical
- Sutures are used to close flaps

Factors predicting difficult exo	<ul style="list-style-type: none"> - Divergent and Dilacerated roots - Endo-treated teeth - Long Roots or resorbed roots - Dense Bone (Posterior mandible is the densest) - Root Fracture - Proximity to the floor of sinus or IAN - Limited opening - Bruxism - Exostoses or tori - Gross caries - Severe crowding
-----------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Flap Design	<ul style="list-style-type: none">- Wider base -> ensures adequate blood supply- Incisions made over intact bone, not defects of eminences- Rounded corners- Vertical releases at line angles- Avoid vital structures- Post-op plaque control is the most important procedure after perio surgery					
						
						
	Envelope Flap	0 Vertical releases - 2 teeth anterior, 1 posterior				
	3-cornered flap	1 vertical release - 1 tooth anterior and posterior				
	Trapezoidal	2 vertical releases - 1 tooth anterior and posterior				
	Semilunar Incision	Apical to mucogingival junction - For apicoectomy - Apically displaced flap is not possible in the maxillary palate				
Double Y Incision	Incision down the palatal midline - 2 vertical releases at each end - Used for Palatal torus removal					
Surgical Handpieces	<p>No Air! -> Air Emphysema risk</p> <p>Uses:</p> <ul style="list-style-type: none">- Remove buccal bone<ul style="list-style-type: none">- Create a ditch /trough to act as a purchase point and pathway for delivery- Careful/probably don't do this if implant is planned- Remove interradicular bone<ul style="list-style-type: none">- Moves center of resistance apically and facilitates tooth removal- Careful if an implant is planned- Section tooth<ul style="list-style-type: none">- Split the tooth in half, insert elevator to complete the break and extract each piece separately					
Removal of root tip	<ul style="list-style-type: none">- Gouge into the adjacent bone with the root tip pick- Remove facial bone and elevate it facially- Make a bone window at the apex to push the root out					

Implants

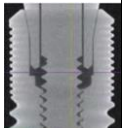

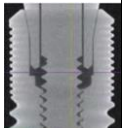

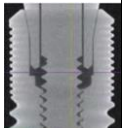

Indications	Replace Missing Teeth (obviously)
Relative Contraindications	<ul style="list-style-type: none"> - Uncontrolled Diabetes - Immunocompromised patients - Inadequate volume of bone and height - Bisphosphonate Therapy - Bruxism - Smoking - Hx of head/neck radiation - Cleft Palate - Adolescence <p><i>*Old age is not a contraindication*</i></p>

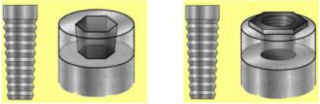

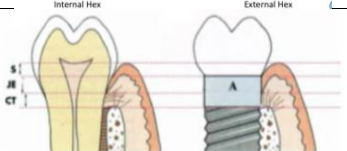

3 Categories of Implants (Generally)

Subperiosteal	Implant rests under the periosteum <ul style="list-style-type: none"> - No true osseointegration - Poor prognosis
Transosteal	Only Mandibular anterior <ul style="list-style-type: none"> - Extraoral approach! - Usually 4 needed to support a mandibular denture
Endosteal	Placed into the bone <ul style="list-style-type: none"> - Largest category these days - Usually these days we see "Root Form" shape

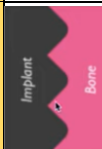

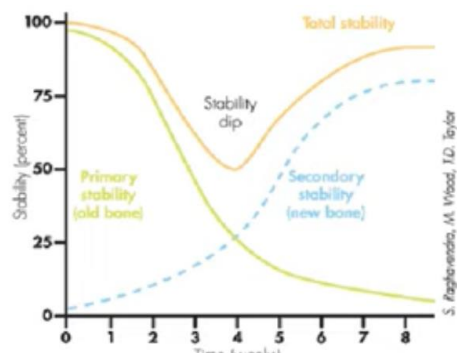

Endosteal Implants

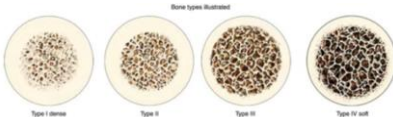

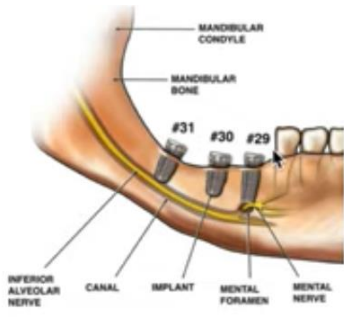

Components		Implant Crown				
		Abutment Screw				
		Abutment				
		Implant Body				
	Implant Body 	<p>= Implant/Fixture</p> <ul style="list-style-type: none">- Usually Axis-symmetric (symmetric around the long axis) <p>Procedures:</p> <ul style="list-style-type: none">- Sequentially enlarge an osteotomy (bone hole)<ul style="list-style-type: none">- ↓ heat generation = keeps bone cells alive (needed for osseointegration)- Pilot Hole helps maintain axis w/ free-hand surgery- Usually inserted into tapped holes (kinda like a pilot hole, but with threads in the hole) -> Some implants are “self-tapping” and can cut their own threads into the bone as it is placed				
	Abutment	<table><tr><th>One Piece</th><th>Two Piece</th></tr><tr><td><p>= Abutment + Abutment screw are 1 component</p><ul style="list-style-type: none">- No antirotation component ☹️</td><td><p>= Abutment screw and abutment body are separate (more common)</p><ul style="list-style-type: none">- Has an antitotational component</td></tr></table>	One Piece	Two Piece	<p>= Abutment + Abutment screw are 1 component</p> <ul style="list-style-type: none">- No antirotation component ☹️ 	<p>= Abutment screw and abutment body are separate (more common)</p> <ul style="list-style-type: none">- Has an antitotational component 
One Piece	Two Piece					
<p>= Abutment + Abutment screw are 1 component</p> <ul style="list-style-type: none">- No antirotation component ☹️ 	<p>= Abutment screw and abutment body are separate (more common)</p> <ul style="list-style-type: none">- Has an antitotational component 					

	Implant Crown	Screw Retained = Screw through the crown into the implant <ul style="list-style-type: none">- Crown and abutment are usually 1 piece and the abutment screw is separate Cons: <ul style="list-style-type: none">- Screw access hole ↓ esthetics- Sometimes not possible for angled implants Pros: <ul style="list-style-type: none">- Retrievable- Better for restoring restricted restorative space	Cement-Retained = Abutment is attached to the implant separately (with cement) Cons: <ul style="list-style-type: none">- Cement trapping = Peri-implantitis- Non-retrievable- Needs ↑ restorable space Pros: <ul style="list-style-type: none">- Esthetics				
1 Piece vs 2 Piece Implants	**Different from 1 and 2 piece Abutments <table><tr><th>One Piece</th><th>Two Piece</th></tr><tr><td>= Implant and abutment are attached together as 1 piece<ul style="list-style-type: none">- Drilled into the bone as one unitCons:<ul style="list-style-type: none">- Cannot correct angle between implant and abutment</td><td>= Implant and abutment are separate components<ul style="list-style-type: none">- Implant is placed, then the abutment is attached then the crown attached to abutments</td></tr></table>			One Piece	Two Piece	= Implant and abutment are attached together as 1 piece <ul style="list-style-type: none">- Drilled into the bone as one unit Cons: <ul style="list-style-type: none">- Cannot correct angle between implant and abutment 	= Implant and abutment are separate components <ul style="list-style-type: none">- Implant is placed, then the abutment is attached then the crown attached to abutments
One Piece	Two Piece						
= Implant and abutment are attached together as 1 piece <ul style="list-style-type: none">- Drilled into the bone as one unit Cons: <ul style="list-style-type: none">- Cannot correct angle between implant and abutment 	= Implant and abutment are separate components <ul style="list-style-type: none">- Implant is placed, then the abutment is attached then the crown attached to abutments						
Anti-rotational Component	= Prevents rotation of the abutment in the implant -> Provides stabilization <ul style="list-style-type: none">- Different with each brand- Internal or External Hex 						
Implant Surface	Rough Surface -> for bone integration <ul style="list-style-type: none">- No PDL for implants, ↓ ability to take heavy forces. Restore with light occlusion Smooth surface -> for soft tissue <ul style="list-style-type: none">- Gingival fibers orient next to implant Parallel to implant cuff 						

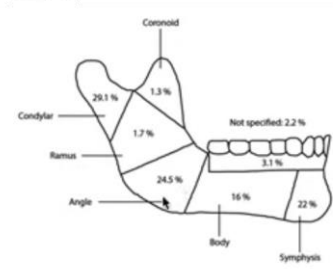

Surgical Considerations

Socket Preservation	<p>= Maintains height and width of alveolar ridge</p> <ul style="list-style-type: none">- Essential to have an atraumatic exo -> No breaking of buccal plate-					
Integration and Stability		Osseointegration	<ul style="list-style-type: none">- Direct histologic contact between bone and implant surface			
		Fibrous Integration	<ul style="list-style-type: none">- Presence of fibrous tissue layer between implant and bone- Will be mobile 😞 -> Considered a failure of osseointegration and implant placement			
	<table><tr><th>Primary Stability</th><th>Secondary Stability</th></tr><tr><td><p>= How stable the implant is when you first place it</p><ul style="list-style-type: none">- How locked in the threads are</td><td><p>= Post-osseointegration, long term healing of bone to the titanium alloy</p></td></tr></table>			Primary Stability	Secondary Stability	<p>= How stable the implant is when you first place it</p> <ul style="list-style-type: none">- How locked in the threads are
Primary Stability	Secondary Stability					
<p>= How stable the implant is when you first place it</p> <ul style="list-style-type: none">- How locked in the threads are	<p>= Post-osseointegration, long term healing of bone to the titanium alloy</p>					
 <p>S. Raghoebar, M. Wood, J.D. Taylor</p>						

Bone Quality	<p>Implant Success rate goes from High to low and you ↑ bone type</p> <p>Type 1:</p> <ul style="list-style-type: none"> - Anterior Mandible - Lots of dense cortical bone, not a lot of trabecular bone for vascularity though <p>Type 2:</p> <ul style="list-style-type: none"> - Posterior Mandible - A good mix of cortical and trabecular bone <p>Type 3:</p> <ul style="list-style-type: none"> - Anterior Maxilla - Less cortical bone and more trabecular bone -> ↓ stability <p>Type 4:</p> <ul style="list-style-type: none"> - Posterior Maxilla - Worst type of bone, not a lot of cortical bone there 				
Implant Placement Boundaries	<p><u>1mm Away from</u></p> <ul style="list-style-type: none"> - Buccal Plate - Lingual Plate - Inferior Border - Max Sinus - Nasal Cavity <p><u>1.5mm away from:</u></p> <ul style="list-style-type: none"> - Adjacent Teeth <p><u>2mm:</u></p> <ul style="list-style-type: none"> - IAN <p><u>3mm</u></p> <ul style="list-style-type: none"> - Adjacent Implant <p><u>5mm</u></p> <ul style="list-style-type: none"> - Mental Nerve (because of the anterior loop) 				
1 Stage vs 2 Stage	<table border="1"> <thead> <tr> <th data-bbox="391 972 902 1003">One Stage</th><th data-bbox="902 972 1511 1003">Two Stage</th></tr> </thead> <tbody> <tr> <td data-bbox="391 1003 902 1266"> <p>= Implant and healing abutment are placed at the same appointment</p> <ul style="list-style-type: none"> - Possible with good Primary Stability - Creates a good soft tissue emergency profile  </td><td data-bbox="902 1003 1511 1266"> <p>= Implant is placed and capped with a cover screw during osseointegration</p> <ul style="list-style-type: none"> - Open up and place abutment at the next visit <p><u>Used if:</u></p> <ul style="list-style-type: none"> - Poor primary stability - Graft placement is indicated - Immunocompromised patient (closing it up ↓ infection risk)  </td></tr> </tbody> </table>	One Stage	Two Stage	<p>= Implant and healing abutment are placed at the same appointment</p> <ul style="list-style-type: none"> - Possible with good Primary Stability - Creates a good soft tissue emergency profile 	<p>= Implant is placed and capped with a cover screw during osseointegration</p> <ul style="list-style-type: none"> - Open up and place abutment at the next visit <p><u>Used if:</u></p> <ul style="list-style-type: none"> - Poor primary stability - Graft placement is indicated - Immunocompromised patient (closing it up ↓ infection risk) 
One Stage	Two Stage				
<p>= Implant and healing abutment are placed at the same appointment</p> <ul style="list-style-type: none"> - Possible with good Primary Stability - Creates a good soft tissue emergency profile 	<p>= Implant is placed and capped with a cover screw during osseointegration</p> <ul style="list-style-type: none"> - Open up and place abutment at the next visit <p><u>Used if:</u></p> <ul style="list-style-type: none"> - Poor primary stability - Graft placement is indicated - Immunocompromised patient (closing it up ↓ infection risk) 				
Impression	<p>Once healing is complete, final impression is made so the crown and abutment are properly oriented</p> <ul style="list-style-type: none"> - Impression coping is used to transfer the location and angulation of the implant to a master cast - Open Tray -> Hole in the tray for the coping to pop out of - Closed tray -> No hole in the tray - <u>Analog</u> = Implant replica that is set into the cast 				
Surgical Stent	<p>= Used to help guide the implant drill as we deliver the implant</p> <p>L – Location A – Angulation D - Depth</p> 				

Implant Success	<p>4 Characteristics of a successful implant:</p> <ol style="list-style-type: none"> 1. Immobile 2. No Peri-implant RL 3. Peri-implant bone loss <0.2mm per year after the 1st year 4. Absence of symptoms (pain)
Implant Failure	<p>Associated with Gram –ve anaerobic rods and Filaments</p> <p><u>Temperature:</u> 47°C for 1 minute, or 40° for 7 minutes is enough to compromise osseointegration</p> <p>If any of the above 4 keys for success are not present, it is considered an implant failure</p>

Trauma and Orthognathic Surgery

Mandibular Fractures	<p>* Best evaluated using a Pan Radiograph*</p> <p>Condylar Fractures > Angle Fractures > Symphysis Fractures > Body > Alveolus > Ramus > Coronoid</p> <div><p>*Typically the Condyle is fractured on the contralateral side of the blow*</p><table><tr><td>Greenstick Fracture</td><td>= Incomplete (not all the way through)</td></tr><tr><td>Comminuted</td><td>= Crushed into multiple fragments</td></tr><tr><td>Simple</td><td>= Closed to the oral cavity</td></tr><tr><td>Compound</td><td>= Open to oral cavity, bone exposed through the mucosa</td></tr></table><p>**Ideally treated with Open Reduction + Internal Fixation (ORIF)*</p></div>	Greenstick Fracture	= Incomplete (not all the way through)	Comminuted	= Crushed into multiple fragments	Simple	= Closed to the oral cavity	Compound	= Open to oral cavity, bone exposed through the mucosa				
Greenstick Fracture	= Incomplete (not all the way through)												
Comminuted	= Crushed into multiple fragments												
Simple	= Closed to the oral cavity												
Compound	= Open to oral cavity, bone exposed through the mucosa												
Midface Fractures	<p>*Best evaluated with CBCT*</p> <table><tr><td>Le Fort I</td><td>Horizontal across the maxilla</td><td></td></tr><tr><td>Le Fort II</td><td>Pyramidal<ul style="list-style-type: none">- Involves medial orbit and nasal bone</td><td></td></tr><tr><td>Le Fort III</td><td>= Complete cranial fracture disjunction</td><td></td></tr><tr><td>Zygomaticomaxillary Complex fracture</td><td>= Caused by direct blow to the malar eminence (check bone)<ul style="list-style-type: none">- Involves bleeding under the conjunctiva of the eye</td><td></td></tr></table>	Le Fort I	Horizontal across the maxilla		Le Fort II	Pyramidal <ul style="list-style-type: none">- Involves medial orbit and nasal bone		Le Fort III	= Complete cranial fracture disjunction		Zygomaticomaxillary Complex fracture	= Caused by direct blow to the malar eminence (check bone) <ul style="list-style-type: none">- Involves bleeding under the conjunctiva of the eye	
Le Fort I	Horizontal across the maxilla												
Le Fort II	Pyramidal <ul style="list-style-type: none">- Involves medial orbit and nasal bone												
Le Fort III	= Complete cranial fracture disjunction												
Zygomaticomaxillary Complex fracture	= Caused by direct blow to the malar eminence (check bone) <ul style="list-style-type: none">- Involves bleeding under the conjunctiva of the eye												

Trauma Surgery		
Reduction	= Fracture fragments are returned to their normal position	
	Open Reduction	Closed Reduction
	= Fragments are exposed surgically by dissecting the tissues	= Fragments are manipulated without surgical exposure
Fixation	= Holding the bone together for healing	
	Internal Fixation	Intermaxillary Fixation (MMF)
	= Using titanium plates and screws to hold the bone together	= Wiring the jaws closed, archbars, and elastics

Skeletal Discrepancies

Retrognathic Mandible	Class II
Prognathic Mandible	Class III
Apertognathic	Anterior Open Bite
Vertical Maxillary Excess	Maxilla is too long - Gummy smile
Horizontal transverse Discrepancy	Posterior crossbite
Macrogenia	Chin is too big
Microgenia	Chin is too small

Orthognathic Surgery

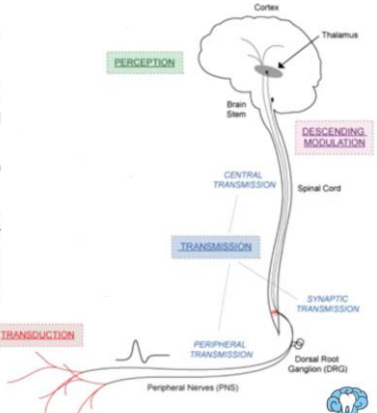

- Correction of severe skeletal discrepancies
- Need Lateral Ceph! CBCT is also becoming more common
- Use **Acrylic splint intraoperatively** -> Occlusion is used to guide the surgical outcome

Le Fort I Surgery	= Move the Maxilla <i>Indicated:</i> <ul style="list-style-type: none">- Retrusive maxilla- Vertical maxillary excess	
Bisagittal Split Osteotomy (BSSO)	= Move Mandible <i>Indication:</i> <ul style="list-style-type: none">- Retrusive Mandible- Protrusive Mandible *Nerve damage = most common post-op complication	
Genioplasty	= Move chin	
Distraction Osteogenesis (DO)	= Bone deposition between 2 bone surfaces that are separated by gradual traction <ul style="list-style-type: none">- Bone lengthening (not width though) <u>Phase 1:</u> <ul style="list-style-type: none">- Osteotomy -> Split the bone in 2 pieces <u>Phase 2:</u> <ul style="list-style-type: none">- Latency Phase -> appliance is mounted to the bone but not activated for 1 week <u>Phase 3:</u> <ul style="list-style-type: none">- Distraction Phase -> Appliance is activated to gradually separate the 2 pieces as bone fills in the gap	

Orofacial Pain

Biopsychosocial Model of Pain		
- Bio	Axis I	Nociceptive input from somatic tissue <ul style="list-style-type: none">- Acute
- Psychosocial	Axis II	Influence of interaction between Thalamus, Cortex and Limbic structures <ul style="list-style-type: none">- Chronic (>6 months) *Its not just about the tooth (Axis I) but also the person with the tooth (Axis II)

Pain Pathway

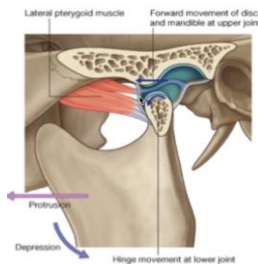

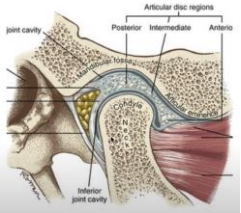

1. Transduction	Pain info travels from the Peripheral NS to the Central NS	
2. Transmission	Pain info travels from the CNS to the Thalamus and higher cortical centers	
3. Modulation	Limitation of the flow of pain info	
4. Perception	Human experience of pain -> Sum total of these 3 above steps + Psychologic factors of higher thought and emotion	

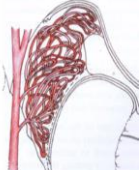

Pains

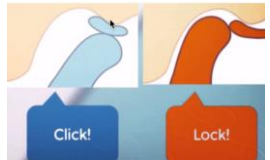

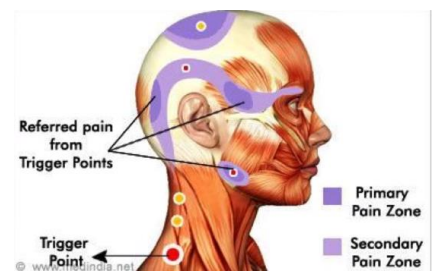

Somatic Pain	<p>↑ Stimulus yields ↑ Pain</p> <ul style="list-style-type: none"> - This is the typical dental pain - Dependent on magnitude of the stimulus <p><u>Musculoskeletal</u></p> <ul style="list-style-type: none"> - TMJ - Periodontal - Myofascial (muscles) <p><u>Visceral</u></p> <ul style="list-style-type: none"> - Salivary Glands - Pulpal
---------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Neuropathic Pain	= Independent of stimulus intensity - Caused by damage to the pain pathways -> Trigeminal Neuralgia, Trauma, Stroke	
	Trigeminal Neuralgia (TN) - Tic Douloureux	Affects postmenopausal women (>50) most frequently <u>Symptoms:</u> <ul style="list-style-type: none"> - Typically a specific location trigger point - Electrical Sharp, Shooting and Episodic followed by refractory periods - Unilateral, can affect any of the 3 branches <u>Tx:</u> <ul style="list-style-type: none"> - Anticonvulsants (Carbamazepine) - Surgery 
	Atypical Odontalgia (AO)	= Secondary to de-afferentation (removal of part of the neural pathway) as a result of RCT or Exo - Localized Phantom toothache 
	Postherpetic Neuralgia (PHN)	= Potential sequela of Herpes Zoster infection <u>Symptoms:</u> <ul style="list-style-type: none"> - Burning, Aching, Shock-like <u>Tx:</u> <ul style="list-style-type: none"> - Anticonvulsants - Antidepressants - Sympathetic blockers
	Burning Mouth Syndrome (BMS)	Affects postmenopausal women (>50) usually <u>Associations:</u> <ul style="list-style-type: none"> - Type II Diabetes, Malnutrition, Xerostomia <u>Characteristics:</u> <ul style="list-style-type: none"> - Burning pain, dryness, possible altered taste
	Chronic Headache (CH) - Neurovascular Pain	Migraine <ul style="list-style-type: none"> - Unilateral, pulsating, nausea and vomiting - Photophobia and Phonophobia (↓ ability to withstand sound and light) <p>Tx: Tryptan (Selective Serotonin receptor agonist)</p> Tension Type <ul style="list-style-type: none"> - Bilateral, non-pulsating, not aggravated by routine activity Cluster <ul style="list-style-type: none"> - Intense pain near one eye
Psychogenic Pain	Intrapsychic Disturbance <ul style="list-style-type: none"> - Conversion Reaction - Psychotic delusion - Malingering 	
Atypical Pain	Facial pain of unknown cause/diagnosis is pending	

Temporomandibular Joint Disorder (TMD)

Anatomy		
TMJ Anatomy	Consists of: <ul style="list-style-type: none"> - Condylar Head - Mandibular (glenoid) fossa - Articular eminence - Articular Disc  <p>Lower Joint Space (Inferior to the disc) = Rotational movement Upper Joint Space (Superior to the disc) = Translation</p> 	

TMJ Muscles	<u>Opening:</u> <ul style="list-style-type: none"> - Lateral Pterygoid <u>Closing:</u> <ul style="list-style-type: none"> - Masseter - Temporalis - Medial Pterygoid
Ligaments	= Limit movement of the mandible from overextending <ul style="list-style-type: none"> - Capsular Ligament -> Completely covers the TMJ - Disc/collateral ligament -> Attaches to the medial and lateral poles of the condyle, keeps the disc attached during movement - Posterior Ligament -> From articular disc to back of condyle (prevents anterior disc displacement) - Lateral Ligament -> Wraps around condyle from the disc (prevents posterior displacement)
Blood Supply to TMJ	M – Maxillary artery A – Ascending Pharyngeal D – Deep Articular artery S – Superficial Temporal 

TMJ Dysfunctions	
Disc Displacement/Internal Derangement	<u>With Reduction:</u> <ul style="list-style-type: none"> - Clicking - Condyle pops over the anteriorly displaced disc and pops on the way back into the fossa  <u>Without Reduction:</u> <ul style="list-style-type: none"> - Locked - Condyle stuck behind the disc = ↓ range of motion with ipsilateral deviation on opening - Deviation to the side with the issue
Opening Patterns	<u>Deflection</u> = Deflects towards the side that is stuck at maximum opening <ul style="list-style-type: none"> - This condyle can only rotate, but it cannot translate <u>Deviation</u> = Deviates towards 1 side and returns back to midline at max. opening <ul style="list-style-type: none"> - Could be a variation of normal - Have a "V" in the name, and forms a V pattern 
Recurrent Dislocation	= Mandibular condyle translates anterior to the articular eminence and needs mechanical manipulation to reduce back into the fossa <ul style="list-style-type: none"> - Move Jaw Down and Back to get over the hump of the eminence <u>Tx:</u> <ul style="list-style-type: none"> - Botox injection of the lateral pterygoid, or surgery 
Ankylosis	= Union between condyle and skull -> severely restricted range of motion <ul style="list-style-type: none"> - Commonly caused by Trauma (surgery, radiation and infection can also cause)
Bruxism	= Clenching/grinding teeth <ul style="list-style-type: none"> - Can be daytime or nocturnal - Caused often by stress <u>Tx:</u> <ul style="list-style-type: none"> - Occlusal guard (distributes the occlusal forces evenly and relax the muscles of mastication)
Myofascial Pain Syndrome (MPS)	= Chronic muscular pain disorder -> Diffuse pain in the preauricular area <ul style="list-style-type: none"> - Considered Somatic pain - Pain can occur at rest - Most common cause of masticatory pain - Trigger points are present in the muscles of mastication <u>Tx:</u> <ul style="list-style-type: none"> - Physical Therapy - Stress management - Splint therapy - Medications 

Treatments:

Non-Surgical	<p><u>Counselling</u></p> <ul style="list-style-type: none"> - Address parafunctional habits (grinding, nail biting etc) <p><u>Medical Therapy</u></p> <ul style="list-style-type: none"> - NSAIDs, Steroids, Analgesics, Antidepressants, Muscle relaxants <p><u>Physical Therapy</u></p> <ul style="list-style-type: none"> - Transcutaneous electrical nerve stims, massage, thermal Tx, Exercise <p><u>Occlusion</u></p> <ul style="list-style-type: none"> - Splint therapy to ↓ intra-articular pressure <p><u>Arthrocentesis</u></p> <ul style="list-style-type: none"> - 2 needles flush out superior joint space
Surgery	<p><u>Arthroscopy</u></p> <ul style="list-style-type: none"> - 2 cannulas + instrumentation within the superior joint space <p><u>Arthroplasty</u></p> <ul style="list-style-type: none"> - Disc is surgically repositioned - Indicated for persistent painful clicking or closed lock <p><u>Discectomy</u></p> <ul style="list-style-type: none"> - Disc/removal if it is severely damaged <p><u>Condylotomy</u></p> <ul style="list-style-type: none"> - Vertical ramus osteotomy → bone is not fixated, allows the soft tissues to reposition the condyle where they are happiest <p><u>Total joint replacement</u></p> <ul style="list-style-type: none"> - Reserved for severely pathologic joints (Osteo or Rheumatoid Arthritis) <p>**Careful of the Facial nerve for any of these surgeries**</p>

Biopsy Technique

= Indicated after 2 weeks observation of Red/White Lesion

4 Types	
Cytology (Brush Biopsy)	<p>= Scrape the lesion with a kit brush or tongue depressor</p> <ul style="list-style-type: none"> - Cells are smeared on a glass slide and fixed immediately <p><u>Indications</u></p> <ul style="list-style-type: none"> - Monitoring large tissue areas for dysplastic changes <p><u>Cons:</u></p> <ul style="list-style-type: none"> - Many false positives
Fine Needle Aspiration	<p>= use of needle + syringe to suck up contents of a lesion</p> <ul style="list-style-type: none"> - Fluid expelled onto a slide and fixed <p><u>Indications:</u></p> <ul style="list-style-type: none"> - Fluid filled lesions - Ascertaining the type of fluid (rule out vascular lesions before cutting into them!) - Exploration of intraosseous lesions <p><u>Pros:</u></p> <ul style="list-style-type: none"> - Good at differentiating Benign vs Malignant
Incisional	<p>Deep, Narrow Wedge cut</p> <p><u>Indications:</u></p> <ul style="list-style-type: none"> - Large lesions (>1cm diameter) - Malignant suspicion
Excisional	<p>= Complete excision of the lesion</p> <ul style="list-style-type: none"> - 2-3mm margin - Elliptical incision used (easier to close) <p><u>Indications:</u></p> <ul style="list-style-type: none"> - Small <1cm - Benign suspicion

Techniques

1. Form a DDx list -> this will help determine the type of biopsy indication
2. Identify the lesion margin with an indelible ink marker
3. Use **Block Anesthesia** when you can -> Local infiltration can distort the architecture of the lesion
4. Don't handle tissue directly (will crush the cells) -> Use tissue forceps!
5. Sample stored in 10% Formalin (H&E Staining) or Michaels Medium (Direct Immunofluorescence if pemphigoid/pemphigus is suspect_

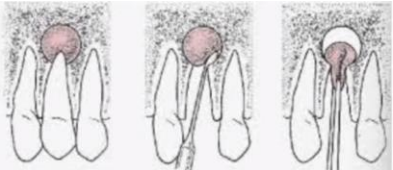

Clinical Examples

Case	Biopsy type
Large white patch on buccal mucosa that wipes off w/ gauze presumed to be candidiasis	- Cytology brush biopsy
Firm rough 2x3cm white lesion on lateral tongue that does not wipe off with gauze	- Incisional Biopsy
Denture wearer presents w/ red swelling in the buccal vestibule	- No biopsy -> adjust the denture and follow up in 2 weeks

Cysts and Tumors

Cysts -> Enucleation, Marsupialization, Curettage

Tumors -> Enucleation, Curettage, Resection

Enucleation	= Surgical removal of mass w/o cutting into it or rupturing it 
Marsupialization	= Cut a slit into an abscess or cyst and suture the edges of the flap to keep it open so it can drain freely <ul style="list-style-type: none"> - Used when cyst is close to vital structures - Can be used for I&D techniques
Curettage	= Removal of tissue by scraping or scooping to remove granulation/infectious tissue
Resection	= Surgical removal of cyst or tumor + normal tissue around it

Medical Emergencies

S – Stop Tx

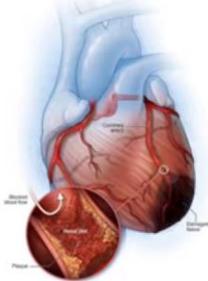

P – Position Patient

O – Oxygen*

R - Reassure (staff and patient)

T – Take Vitals

Syncope	= Most common emergency in dental chair <u>Vasovagal syncope</u> -> Most common form, related to needle anxiety <u>Orthostatic Hypotension</u> -> 2 nd most common, BP drops when standing suddenly <u>Tx:</u> <ul style="list-style-type: none"> - Place in Trendelenburg position (Supine) - If Pregnant: Left Lateral Decubitus to relieve inferior vena cava 	
Epinephrine OD	= Rapid, Intravascular injection <ul style="list-style-type: none"> - Make sure you aspirate! <u>SS:</u> <ul style="list-style-type: none"> - ↑ BP and HR - Thumping heart palpitations 	

Angina	<p>= Chest pain from coronary arteries not being able to provide enough blood to the cardiac tissues</p> <ul style="list-style-type: none"> - Ischemia w/o necrosis - Stable: Predictable with activity and stress - Unstable: Spontaneous, no precipitating factors, at rest <p>Tx: O - Oxygen N – Nitroglycerin (0.4mg) -> 5 mins -> NTG -> 5 mins -> NTG A – Aspirin (with 3rd dose of NTG + call 911)</p> 								
Myocardial Infarction (Heart attack)	<p>= Angina caused by ischemia w/ necrosis</p> <ul style="list-style-type: none"> - Sudden occlusion of major coronary vessel (often, Left Anterior Descending Artery, LAD) <p>Tx: M - Morphine O - Oxygen N – Nitroglycerin (0.4mg) -> 5 mins -> NTG -> 5 mins -> NTG A – Aspirin (with 3rd dose of NTG + call 911)</p> 								
Hypoglycemic Emergency	<p>*Ensure patient has eaten, and has had adequate insulin*</p> <table border="1" data-bbox="337 682 657 991"> <thead> <tr> <th data-bbox="337 682 495 735">HYPOGLYCEMIA SYMPTOMS</th><th data-bbox="495 682 657 735">HYPERGLYCEMIA SYMPTOMS</th></tr> </thead> <tbody> <tr> <td data-bbox="337 735 495 819">SWEATY, SHAKY</td><td data-bbox="495 735 657 819">DRY MOUTH, INCREASED THIRST</td></tr> <tr> <td data-bbox="337 819 495 903">IRRITABILITY, HUNGER</td><td data-bbox="495 819 657 903">WEARINESS, HEADACHE</td></tr> <tr> <td data-bbox="337 903 495 991">LACK OF COORDINATION, SLEEPINESS</td><td data-bbox="495 903 657 991">BLURRED VISION, FREQUENT URINATION</td></tr> </tbody> </table> <p>Tx Hypoglycemia: If Conscious -> Glucose Tab, Orange juice In Unconscious -> IV Dextrose, or IM Glucagon</p>	HYPOGLYCEMIA SYMPTOMS	HYPERGLYCEMIA SYMPTOMS	SWEATY, SHAKY	DRY MOUTH, INCREASED THIRST	IRRITABILITY, HUNGER	WEARINESS, HEADACHE	LACK OF COORDINATION, SLEEPINESS	BLURRED VISION, FREQUENT URINATION
HYPOGLYCEMIA SYMPTOMS	HYPERGLYCEMIA SYMPTOMS								
SWEATY, SHAKY	DRY MOUTH, INCREASED THIRST								
IRRITABILITY, HUNGER	WEARINESS, HEADACHE								
LACK OF COORDINATION, SLEEPINESS	BLURRED VISION, FREQUENT URINATION								
Hyperventilation	<p>↑ O₂ ↓ CO₂ in blood</p> <p>**Do not give O₂, It will make it worse*</p> <p>Tx:</p> <ul style="list-style-type: none"> - Position Pt upright - Get them to breathe into a paper bag (they rebreathe their CO₂) 								
Asthma	<p>= Constriction + Inflammation of bronchioles</p> <ul style="list-style-type: none"> - Wheezing = high pitch on exhale (Cardinal sign) - Avoid NSAIDs and narcotics <p>Tx</p> <ul style="list-style-type: none"> - 2 puffs from inhaler (Albuterol, relaxes smooth muscle in bronchioles) 								
Airway Obstruction	<p>Tx:</p> <ul style="list-style-type: none"> - Clear the pharynx of any food, vomit or foreign objects - Check for breathing (rise and fall of chest, sounds in mouth/nose) - Chin Tilt head lift -> Protrudes tongue and mandible forward 								
Seizure/Convulsions	<p>**Do not restrain, just clear hazards to protect from injury**</p> <p>Tx:</p> <ul style="list-style-type: none"> - IV/IM Benzos (Diazepam) - Grand Mal Seizure (Tonic, Clonic) -> Dilantin/Phenytoin - Status epilepticus (>5 mins) -> Valium/Diazepam 								
Stroke	<p>TIA = Transient Ischemic Accident (Mini stroke, only a few minutes of blockage of blood to the brain) CVA = Cerebrovascular Accident, can be either Thrombotic (blockage), or Hemorrhagic (rupture)</p> <p>Causes:</p> <ul style="list-style-type: none"> - Hyponatremia is one of a few causes <p>Signs:</p> <ul style="list-style-type: none"> - Facial droop, arm lift, slur <p>Tx:</p> <ul style="list-style-type: none"> - O₂ + Call 911 immediately 								

Anaphylactic Shock	<p>= Severe allergic Reaction</p> <p><u>Tx:</u> AEIOU</p> <ul style="list-style-type: none"> - A: Albuterol - E: Epinephrine (0.3mg 1:1000) - I: IM Antihistamine - O: Oxygen - U: U call 911
Anticoagulation	<p><u>Check blood tests:</u></p> <ul style="list-style-type: none"> - CBC -> Anemia, leukopenia, thrombocytopenia - Bleeding Time -> Platelet function - PT -> Anticoagulants, liver damage, Vit K -> Extrinsic clotting Pathway <ul style="list-style-type: none"> - INR -> Warfarin/Coumadin, INR = 2-3 ideally - PTT -> Heparin, Renal dialysis, hemophilia -> Intrinsic clotting pathway <p><u>Herbal anticoagulants:</u></p> <ul style="list-style-type: none"> - Garlic - Ginger - Ginko - Ginseng
