Developmental Conditions

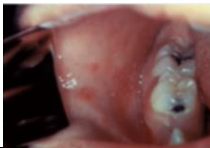

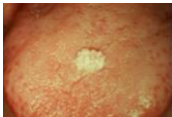

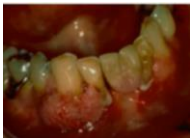

Developmental		
Cleft Lip	<ul style="list-style-type: none"> 1/1000 Births Lack of fusion between the medial nasal process and maxillary process (which normally fuse to form the face) 	  
Cleft Palate	<ul style="list-style-type: none"> 1/2000 births Lack of fusion between the palatal sutures Frequently happens in conjunction with Cleft lip 	  
Lip Pits	<ul style="list-style-type: none"> Invaginations at the commissures or near the midline of the lip <p><i>Associated Syndrome:</i></p> <ul style="list-style-type: none"> Van der Woude Syndrome: Clefts + Pits 	
Fordyce Granules	<ul style="list-style-type: none"> Ectopic sebaceous glands Frequently found on buccal mucosa Completely benign 	
Leukoedema	<ul style="list-style-type: none"> White/Grey edematous lesion of the buccal mucosa Very common on buccal mucosa <p><i>*When lip is stretched, the color goes away*</i></p>	
Lingual Thyroid	<ul style="list-style-type: none"> Thyroid tissue mass at the midline base of the tongue <ul style="list-style-type: none"> This is where thyroid tissue originates during development, it normally migrates down to the neck/trachea area to form the thyroid gland Located along the embryonic path of thyroid descent 	
Thyroglossal Duct Cyst	<ul style="list-style-type: none"> Midline neck swelling Located along the embryonic path of thyroid descent Much like the lingual thyroid, only the tissue did not migrate all the way down 	
Geographic Tongue (Migratory glossitis / Erythema migrans)	<ul style="list-style-type: none"> White ringed lesion surrounding central red islands that migrates over time May be associated with certain foods Occasionally hurts/burns Tx: N/A 	
Fissured Tongue	<ul style="list-style-type: none"> Fold and furrows in the tongue dorsum <p><i>Associated syndrome:</i></p> <ul style="list-style-type: none"> Melkersson-Rosenthal syndrome: Fissured tongue + Granulomatous cheilitis + Facial paralysis "Mels Bells" -> Melkersson, Bells Palsy "Rosy Red" -> Rosenthal + Red swollen lips 	
Angiomas - Tumors of blood vessels or lymph vessels		
Cherry Angioma	<p>= "Red Mole"</p> <ul style="list-style-type: none"> Extremely common Completely benign, small tumor of capillaries 	

Hemangioma	<p>= Congenital focal proliferation of capillaries</p> <ul style="list-style-type: none"> - Most undergo involution as a child -> If it persists though usually get it surgically removed (mostly for esthetics) 	
Lymphangioma	<p>= Congenital focal proliferation of lymph vessels</p> <ul style="list-style-type: none"> - Orally its very rare -> Purple spots on the tongue <p>On neck = Cystic hygroma</p> <p><u>Associated Syndrome:</u></p> <ul style="list-style-type: none"> - Sturge-Weber Syndrome = Angioma of leptomeninges (Arachnoid and Pia mater) + skin along the trigeminal nerve distribution 	
Cysts		
Dermoid Cyst	<ul style="list-style-type: none"> - Mass in the midline floor of the mouth (if above the mylohyoid) or upper neck (if below mylohyoid) - Contains adnexal structures (hair, sebaceous glands) - Doughy consistency -> This is the main distinguishing feature vs a ranula 	
Branchial Cyst	<ul style="list-style-type: none"> - Lateral neck swelling - Epithelial cyst within a lymph node of the neck 	
Oral lymphoepithelial Cyst	<ul style="list-style-type: none"> - Epithelial cyst within the lymph nodes of the oral mucosa - Commonly Palatal or Lingual tonsils 	
Stafne Bone Defect (Lingual Bone Defect)	<p>= Radiolucency in the posterior mandible inferior to the IAN canal</p> <ul style="list-style-type: none"> - Very severe lingual concavity 	
Nasopalatine Duct Cyst	<p>= Heart-shaped radiolucency in the nasopalatine canal</p> <ul style="list-style-type: none"> - Caused by cystification of canal remnants <p>Tx: Surgical Excision</p>	
Globulomaxillary Lesion	<p>= Clinical term for any RL between the Max. Canine and Max. Lateral</p> <ul style="list-style-type: none"> - NOT a diagnosis, just a clinical description 	
Traumatic Bone Cyst (Simple Bone Cyst)	<p>= Large RL that scallops around tooth roots</p> <ul style="list-style-type: none"> - No epithelial lining (so its like a pseudocyst) - Mostly in the mandible of teens and is associated with jaw trauma <p>Tx: Aspirate to diagnose (will usually have blood in them) and monitor</p>	

Mucosal Lesions

Reactive

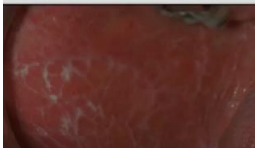

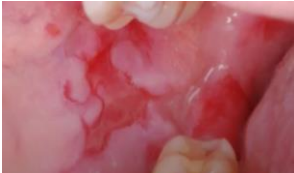

Linea Alba	<p>= White line on buccal mucosa</p> <ul style="list-style-type: none"> - In line with the plane of occlusion <p>Focal hyperkeratosis due to chronic friction on mucosa</p>	
Traumatic Ulcer	<p>Very Common</p> <ul style="list-style-type: none"> - <u>Erosion</u> = Incomplete break of epithelium - <u>Ulcer</u> = Complete break through the epithelium (this is why these are much more painful) 	 
Chemical Burn	<p>Common from:</p> <ul style="list-style-type: none"> - Aspirin (topical application) - Hydrogen Peroxide - Silver Nitrate - Phenol <p><i>*White sloughing mucosa*</i></p>	
Nicotinic Stomatitis	<p>= Red dots -> <u>Inflamed minor salivary duct openings on hard palate</u></p> <ul style="list-style-type: none"> - Only considered pre-malignancy if it is related to "reverse smoking" (putting the lit end of a cigarette in your mouth like an idiot) 	
Amalgam Tattoo	<p>= Traumatic <u>implantation of amalgam particles into mucosa</u></p> <ul style="list-style-type: none"> - Can see clinically or radiographically <p>Don't need to biopsy or treat</p>	 
Smoking-Associated Melanosis	<p>= Chemicals in <u>tobacco stimulate melanocytes to make more melanin</u></p> <ul style="list-style-type: none"> - Brown diffuse irregular macules - Typically in the anterior gingiva (especially with smokeless tobacco AKA snuff) <p>Tx: Reversed if smoking is stopped</p>	
Melanotic Macule	<p>= <u>benign hyperpigmentation in mucous membrane</u> (basically a freckle)</p> <p><u>Associated syndrome:</u></p> <ul style="list-style-type: none"> - Peutz-Jeghers Syndrome = Freckles (lips and mouth) + Intestinal polyps 	
Hairy Tongue	<p>= Elongated <u>filiform</u> papillae</p>	
Dentifrice-Associated Sloughing	<p>= Related to <u>SLS (Sodium-lauryl sulfate)</u></p> <ul style="list-style-type: none"> - Suggest SLS free toothpaste 	
Submucosal Hemorrhage	<p>= Extravascular lesions that do not blanch</p> <ul style="list-style-type: none"> - Vascular lesions (hemangiomas, telangiectasias) do blanch <p><u>Petechiae</u> = 1mm hemorrhages <u>Purpura</u> = slightly large than petechiae <u>Ecchymosis</u> = 1cm or bigger <u>Hematoma</u> = mass of blood within tissue caused by trauma to oral mucosa</p> <p>Tx: Eliminate the cause</p>	

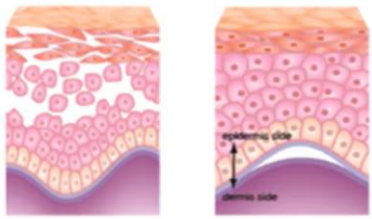

Viral		
Herpes Simplex Virus (HSV)	<p>Primary -> pan-oral, self limiting and typically in children</p> <ul style="list-style-type: none"> - Tx: Palliative (symptomatic relief) - Remains latent in the Trigeminal Ganglion <p>Recurrent -> <u>Keratinized tissue only</u></p> <ul style="list-style-type: none"> - <i>Herpes labialis</i> (cold sores, fever blister) = Vermilion border - <i>Recurrent intraoral herpes</i> = attached gingiva, hard palate <p>*Reactivation is triggered by stress, sunlight, or immunosuppression*</p> <p>Herpetic whitlow -> Finger lesions Herpes Gladiatorum -> Head (typically in wrestlers)</p> <p>Tx: Acyclovir in prodromal period (before it activates)</p>	
Varicella Zoster Virus (VZV)	<p>Primary -> Varicella (AKA Chickenpox) -> self limiting, childhood</p> <ul style="list-style-type: none"> - Latent in the trigeminal ganglion <p>Recurrent -> Herpes Zoster (AKA Shingles)</p> <p>Associated Syndrome: Ramsay Hunt Syndrome</p> <ul style="list-style-type: none"> - Herpes zoster reactivation in geniculate ganglion affecting CN VII and VIII = Facial paralysis, vertigo, deafness <p>Tx: Acyclovir</p>	
Coxsackie Virus	<p>= Hand-foot-and-mouth disease</p> <p>Herpangina -> Posterior oral cavity (soft palate, throat, tonsils)</p>	
Measles (Rubeola)	<p>= Kolik's spots (buccal mucosa dot ulcers -> preceds skin rash)</p> <p>Primary Infection -> Self limiting and typically affects kids</p>	
HPV Papilloma (Wart)	<ul style="list-style-type: none"> - Caused by several HPV strains - Benign epithelia pedunculated or sessile proliferations on skin or mucosa <p>Verucca Vulgaris</p> <ul style="list-style-type: none"> - Common skin wart <p>Condyloma Acuminatum</p> <ul style="list-style-type: none"> - Caused by HPV 6 and 11 - Genital wart or from oral sex w/ someone with genital warts - Tx: Excision w/ high recurrence <p>Focal Epithelial Hyperplasia (Heck's Disease)</p> <ul style="list-style-type: none"> - Caused by HPV 13 and 32 - Multiple small dome-shaped warts on oral mucosa - "whole mouth goes to heck" - Tx: Excision w/ excellent prognosis 	  
Oral Hairy Leukoplakia	<ul style="list-style-type: none"> - Caused by EBV - White patch on lateral tongue -> doesn't wipe off - Opportunistic infection -> associated with HIV or Burkitt's lymphoma 	

Bacterial Infections		
Syphilis	<p>Caused by <i>Treponema pallidum</i> (spirochete)</p> <p>Primary Lesion -> Chancre</p> <p>Secondary Lesion -> Oral mucous patch, condyloma latum, maculopapular rash</p> <p>Tertiary Lesion -> Gumma, CNS involvement, CV involvement</p> <p>Congenital Syphilis = Hutchinson's Triad (notched incisors, mulberry molars, deafness, ocular keratitis)</p>	
Tuberculosis	<p>Inhalation of <i>Mycobacterium tuberculosis</i></p> <ul style="list-style-type: none"> - Oral non-healing chronic ulcers following lung infection <p>Primary -> Ghon complex (inhaled bacteria surrounded by granuloma that undergoes caseating necrosis + infected hilar lymph node draining the first lesion)</p> <p>Secondary -> More widespread lung infection w/ cavitation</p> <p>Miliary -> Systemic spread</p> <p>*HIV Patients are at high risk of progressive disease</p> <p>Tx: Multidrug therapy (isoniazid, rifampin, ethambutol)</p>	
Gonorrhea	<p>= Caused by <i>Neisseria gonorrhea</i></p> <ul style="list-style-type: none"> - Rarely has oral manifestations 	
Actinomycosis	<p>= Caused by <i>Actinomyces israelii</i> (filamentous) -> Not fungal</p> <ul style="list-style-type: none"> - Opportunistic infection, chronic and granulomatous <p>Periapical -> Jaw infections</p> <p>Cervicofacial -> Head and neck infections</p> <p>*Sulfur granules in purulent exudate*</p> <p>Tx: Long-term high dose penicillin</p>	
Scarlet Fever	<p>= Caused by Group A Strep (classically <i>Streptococcus pyogenes</i>)</p> <ul style="list-style-type: none"> - When strep throat becomes systemic <p>Classic sign: Strawberry tongue</p> <ul style="list-style-type: none"> - White-coated tongue w/ red inflamed fungiform papillae <p>Tx: Penicillin</p>	
Fungal		
Candidiasis (Thrush)	<p>Pseudomembranous -> White plaque that rubs off to show erythematous mucosa</p> <p>Atrophic -> Red</p> <p>Median rhomboid glossitis -> Loss of lingual papillae</p> <p>Angular cheilitis -> Corner of mouth</p> <p>Tx: Antifungal (-Azole, -Statin)</p>	
Deep Fungal Infections	<p>These fungi are typically found geographically in soils</p> <p><i>Blastomycosis</i> -> US Northeast, spores inhalation</p> <p><i>Coccidioidomycosis</i> -> US Southwest, Valley Fever</p> <p><i>Cryptococcosis</i> -> US West</p> <p><i>Histoplasmosis</i> -> US midwest</p>	

Immunological Diseases

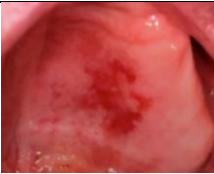

Autoimmune or Hyperimmune responses to either known or unknown stimuli

Aphthous Ulcer (Canker Sore)	<p>99% affects non-keratinized tissues</p> <ul style="list-style-type: none"> - Herpes ulcers (recurrent) happens only on keratinized <p>Minor -> Heals without scarring Major (AKA Suttons Disease) -> Heals w/ scarring</p> <p><u>Associated Syndromes:</u></p> <ul style="list-style-type: none"> - Behcet's Syndrome = Multisystem vasculitis causing aphthous ulcers of oral and genital regions and inflammation of eye <p>Tx: Corticosteroids for Behcets, or Salt rinse for minor</p>	
Erythema Multiforme	<p>Often on lips (but can really happen anywhere on the skin or mucosa)</p> <p>Minor -> Herpes simplex hypersensitivity Major (Steven-Johnson Syndrome) -> drug sensitivity</p>	
Angioedema	<p>= Allergic reaction to drug or food contact</p> <ul style="list-style-type: none"> - Characteristic diffuse swelling of the lips (and/or neck and face) <p>Mediated by <u>mast cell release of IgE and Histamines</u></p> <p>Tx: Antihistamines</p>	
Wegener's Granulomatosis	<p>= Allergic reaction to inhaled antigen</p> <ul style="list-style-type: none"> - Characteristic sign = Strawberry gingivitis <p>Tx: Corticosteroids (prednisone) and cyclophosphamide</p>	
Lichen Planus	<p>T-lymphocytes target and destroy basal keratinocytes</p> <ul style="list-style-type: none"> - Basal zone vacuolization + Sawtooth rete pegs occur secondary to the T-cell mediated destructions <p>Reticular (more common) -> Wickham striae, white and lacy Erosive -> Wickham striae w/ red ulceration</p> <p>Tx: Corticosteroids</p>	
Lupus Erythematosus	<p>Discoid Chronic Type</p> <ul style="list-style-type: none"> - Disc-like lesions on facial skin - Oral lesions mimic erosive lichen planus <p>Systemic Acute Type:</p> <ul style="list-style-type: none"> - Multiple organ involvement - Characteristic butterfly rash over bridge of nose - Because it's systemic, it involves autoantibodies (can do an ANA test to Dx) <p>Tx: Corticosteroids</p>	
Scleroderma	<p>= Hardening of the skin and connective tissue</p> <ul style="list-style-type: none"> - Restricted opening and uniform widening of the PDL Space 	
Pemphigus Vulgaris	<p>= Suprabasilar clefting</p> <ul style="list-style-type: none"> - Autoantibodies against desmosomes - Multiple painful ulcers preceded by bullae - Positive Nikolsky's sign -> sloughing of the outer skin layer <p>Tx: Corticosteroids</p>	

Pemphigoid	<p>"O, Old, Ophthalmologist"</p> <ul style="list-style-type: none"> - Subbasilar - Autoantibodies against Basement membrane <p>Pemphigus = U-bove Pemphigoid = below</p>	 <p>Pemphigus Pemphigoid</p>
-------------------	---	---

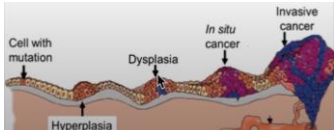

Premalignant Lesions

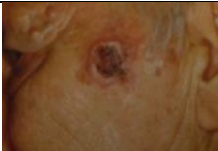

- Risk for developing Squamous Cell Carcinoma

Leukoplakia	<p><i>*This is a clinical description! NOT a Dx*</i></p> <ul style="list-style-type: none"> - White Patch that doesn't rub off and doesn't have an obvious clinical Dx <p><u>Tx</u>: Biopsy mandatory</p>	
Proliferative Verrucous Leukoplakia	<p><i>*Also a clinical description*</i></p> <ul style="list-style-type: none"> - Recurrent and warty - May be associated w/ HPV 16 and 18 (highest risk strains for developing cervical cancer) - High risk of malignant transformation to SCC or Verrucous Carcinoma 	
Erythroplakia	<p><i>*Clinical Description, not a Dx*</i></p> <ul style="list-style-type: none"> - Red patch - Higher risk than leukoplakia for becoming malignant (Erythroleukoplakia is the highest risk) <p>Tx: Biopsy mandatory</p>	
Erythroleukoplakia	<p><i>*Clinical Description, not a Dx*</i></p> <ul style="list-style-type: none"> - Red and white patch - Highest risk for transforming into malignancy <p>Tx: Biopsy mandatory</p>	
Actinic Cheilitis	<p>Actinic = Solar ; Cheilitis = Lip inflammation</p> <ul style="list-style-type: none"> - Due to solar damage (UV-B especially) -> UV-Bad 	
Smokeless Tobacco-Associated Lesion	White mucosal change in vestibule b/c direct effects of smokeless tobacco and its additives	

Malignant Lesions

- Most cancers = Non-painful, non-healing, indurated ulcers
- FOM and posterior lateral tongue = #1 and #2 highest risk sites

Cancer Types	Cancer Stages
<ul style="list-style-type: none"> - Carcinoma -> Epithelial origin - Sarcoma -> Mesenchymal (CT) origin - Leukemia -> Blood - Lymphoma -> Lymphatic tissue 	<p>Dysplasia = Pre-cancer</p> <p>Carcinoma in situ = All of the epithelial layers are affected</p> <p>Malignant Neoplasm = Cancer (invades past the basement membrane)</p> <ul style="list-style-type: none"> - Local invasion -> Connective Tissue - Metastasis -> Access to blood or lymph to travel around the body 

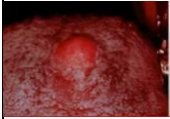

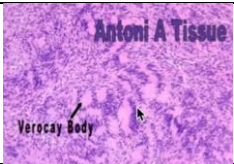

Verrucous Carcinoma (AKA Snuff dippers carcinoma)	<p>= Tobacco and HPV 16 and 18 are the causes</p> <ul style="list-style-type: none"> - Slow growing malignancy <p>Tx: Excision</p>		
Squamous Cell Carcinoma	<p>= Caused by oncogene activation or inactivation of tumor suppressor genes</p> <ul style="list-style-type: none"> - ↑ incidence of oropharyngeal SCC associated w/ HPV 16 and 18 - 5-year survival = 50% 😞 <p>Tx: Excision or radiation</p> <p>Associated Syndrome:</p> <ul style="list-style-type: none"> - Plummer-Vinson Syndrome: mucosal atrophy + Dysphagia + Iron deficiency anemia + ↑ risk of oral cancer 		
Basal Cell Carcinoma	<p>= Caused by sun damage</p> <ul style="list-style-type: none"> - Very rarely metastasizes - The least dangerous cancer 😊 <p>Tx: Surgery</p>		
Oral Melanoma	<p>= Malignancy of melanocytes</p> <ul style="list-style-type: none"> - Purplish/blackish lesions - High risk sites: Palate and gingiva - 5 year survival for skin lesions is > 65%, but <20% for oral lesions 😞 		

Connective Tissue

Benign Tumors (Reactive)

= Lumps or bumps

Fibroma (Traumatic fibroma, irritation fibroma, hyperplastic scar)	<p>= Fibrous hyperplasia of oral mucosa</p> <ul style="list-style-type: none"> - Caused by chronic trauma or irritation 		
Gingival Hyperplasia (VERY commonly tested)	<p><u>Caused by:</u></p> <ul style="list-style-type: none"> - Calcium Channel Blockers (Nifedipine) - Anti-convulsant/epileptic (Dilantin/Phenytoin) - Immunosuppressant (Cyclosporin) <p>Tx: Gingivectomy and discontinue drug if possible</p>		
Denture-induced Fibrous Hyperplasia	<p><u>Epilus Fissuratum</u> = @ base of vestibule</p> <ul style="list-style-type: none"> - Over-extended flange of the denture causes this <p><u>Papillary hyperplasia</u> = @ hard palate</p> <ul style="list-style-type: none"> - Caused by poor denture hygiene 		
Traumatic Neuroma	<p>= Entangled submucosal mass of neural tissue with scar formation</p> <ul style="list-style-type: none"> - Caused by nerve injury - Most common at mental foramen <p>Associated Syndrome:</p> <ul style="list-style-type: none"> - <u>Multiple Endocrine Neoplasia (MEN 2B)</u> = Multiple neuromas (NOT Traumatic) + Medullary thyroid cancer + Pheochromocytoma of the adrenal gland - "MEN is short for Mental foramen, which is most commonly associated with this lesion" 		

Pyogenic granuloma	= Hyperplasia of capillaries (causes red colour) <ul style="list-style-type: none"> - Caused by chronic trauma or irritation - Very common on the gingiva 	
Nodular Fasciitis	= Neoplasm of fibroblasts <ul style="list-style-type: none"> - Easy to eradicate and rarely recurs Tx: Surgical Excision	
Fibromatosis	= Neoplasm of fibroblasts (again) <ul style="list-style-type: none"> - Difficult to eradicate and often recurs (Opposite of nodular fasciitis) 	
Granular Cell Tumor	= Neoplasm of Schwann Cells <ul style="list-style-type: none"> - Named because they have granular cytoplasm (histologically) - Most common on dorsal tongue - Variant found on the gingiva = Congenital Epulis of newborn Pseudoepitheliomatous Hypoplasia (PEH) within this tumor mimics SCC histologically	 
Schwannoma (Neurilemmoma)	= Neoplasm of Schwann cells <ul style="list-style-type: none"> - Acellular Verocay bodies in Antoni A Tissue, forms a line of scrimmage 	
Neurofibroma	= Neoplasm of Schwann cells + Fibroblasts <p>Associated Syndrome:</p> <ul style="list-style-type: none"> - Neurofibromatosis Type I (Von Recklinghausen's disease) = Multiple neurofibromas + multiple skin freckles (Café au lait spots) + Axillary freckles (Crowe's sign) + Iris freckles (Lisch spots) - "Von Frecklinghausen" disease - Neurofibromas can transform to neurofibrosarcoma with this disease 	
Leiomyoma	= Neoplasm of smooth muscle cells	
Rhabdomyoma	= Neoplasm of skeletal muscle cells	
Lipoma	= Neoplasm of fat cells <ul style="list-style-type: none"> - Most common on buccal mucosa 	

Malignant Tumors

- Most are malignant conversion of the benign tumors
- Look very similar to the benign ones

Fibrosarcoma	= Malignant proliferation of fibroblasts	
Neurofibrosarcoma (Malignant peripheral nerve sheath tumor)	= Malignant proliferation of Schwann Cells	
Kaposi's Sarcoma	= Malignant proliferation of endothelial cells <ul style="list-style-type: none"> - Caused by HHV8 and most commonly seen as a complication of AIDS - Purple lesion 	
Leiomyosarcoma	= Malignant proliferation of smooth muscles cells	
Rhabdomyosarcoma	= Malignant proliferation of Skeletal muscle cells	
Liposarcoma	= Malignant proliferation of fat cells	

Salivary Gland Diseases

Reactive Lesions

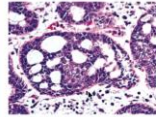

Mucous Extravasation Phenomenon	<p>*Caused by trauma to salivary duct*</p> <ul style="list-style-type: none"> - NOT necessarily surrounded by epithelium - Mucocele: Common in lower lip. Blockage of duct, typically from trauma - Ranula: when found on FOM <p>Tx: Complete excision of the minor gland (and its surrounding glands)</p>	
Mucous Retention Cyst	<p>= Same as above histologically, however it is a true cyst lined by epithelium</p> <ul style="list-style-type: none"> - Caused by blockage of salivary duct by a sialolith 	
Necrotizing Sialometaplasia	<p>= Rapidly expanding ulcerative lesion</p> <ul style="list-style-type: none"> - Due to ischemic necrosis of minor salivary glands (response to trauma or LA) <p>Tx: Heals on its own in 6-10 weeks. Treat palliatively</p>	
Sinus Retention Cyst (Antral Pseudocyst)	<p>= Blockage of glands in the sinus mucosa</p> <p>Tx: None</p>	
Sarcoidosis	<p>Hyperimmune -> so there are granulomas involved</p> <ul style="list-style-type: none"> - May be triggered by Mycobacteria (same as TB) <p>Primarily a pulmonary disease, but also affects salivary glands and mucosa</p> <ul style="list-style-type: none"> - Causes Xerostomia <p>Associated Syndromes:</p> <ul style="list-style-type: none"> - Lofgren's Syndrome = Erythema nodosum + Bilateral hilar lymphadenopathy + arthritis - Heerfordt Syndrome (AKA Uveoparotid Fever) = Anterior uveitis + parotid gland enlargement + Facial nerve Palsy + Fever <p>Tx: Corticosteroids</p>	
Sjogren's Syndrome	<p>Autoimmune and lymphocyte mediated</p> <ul style="list-style-type: none"> - Affects salivary and tear glands <p>Primary = Keratoconjunctivitis sicca (Dry eyes) + Xerostomia (Dry mouth)</p> <p>Secondary = Primary + another autoimmune disease (usually rheumatoid arthritis)</p> <p>Tx: Symptomatic</p>	

Benign Lesions

Pleomorphic Adenoma	<p>**Most common benign salivary gland tumor**</p> <ul style="list-style-type: none"> - Composed of a mixture of cell types (Epithelial and CT) -> hence why it is AKA "Mixed Tumor" - Firm rubbery swelling (from small to large) <p>Location: Palate (if minor salivary gland) Ear (if parotid gland)</p>	
Monomorphic Adenoma	<ul style="list-style-type: none"> - Composed of single cell type <p>Includes: Basal cell adenoma, Canalicular adenoma, myoepithelioma, oncocytic tumor</p> <p>Tx: Surgical Excision</p>	
Warthin's Tumor	<p>Composed of oncocytes + lymphoid cells</p> <ul style="list-style-type: none"> - Oncocyte = epithelial cells w/ excessive mitochondria <p>Location: Parotid of older men</p>	

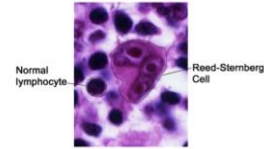

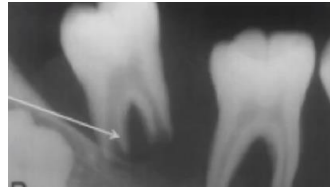

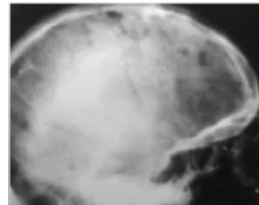

Malignant Lesions

- All of these are most common on the palate

Mucoepidermoid Carcinoma	**Most common salivary gland malignancy** <ul style="list-style-type: none"> - Composed of mucous and epithelial cells 	
Polymorphous Low-Grade Adenocarcinoma (PLGA)	= 2 nd most common salivary gland malignancy for minor glands Adeno = gland	
Adenoid Cystic Carcinoma	**Cribiform/Swiss cheese microscopic pattern** 5-year survival is 70%; 15 survival is 10% -> Very lethal	 

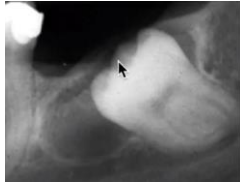

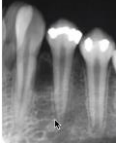

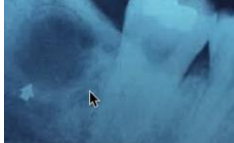

Lymphoid Neoplasms

- All lymphoid neoplasms are malignant in nature -> Because at this point they have already broken through the basement membrane etc

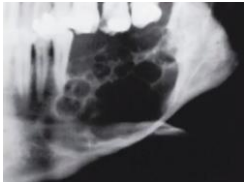

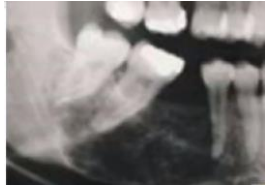

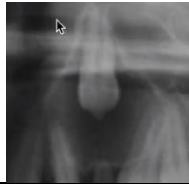

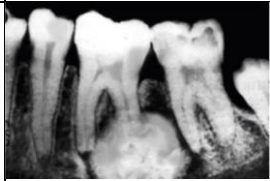

Hodgkin's Lymphoma	**Rare in the oral cavity** Involves <i>Reed-Sternberg cells</i> = Malignant B cells Tx: Chemo +/- Radiation	
Non-Hodgkin's Lymphoma (NHL) 	= Neoplasm of either B or T cells <i>Burkitt's Lymphoma</i> = Type of B cell NHL w/ bone marrow involvement, swelling, pain, tooth mobility, lip paresthesia, and halted tooth development Tx: Chemo +/- Radiation	
Multiple Myeloma (Plasma Cell myeloma)	= Neoplasm of antibody-secreting B cells (<i>plasma cells</i>) - <i>Multiple punched out radiolucencies</i> (usually in the skull) Amyloidosis due to accumulation of complex amyloid proteins that come from antibody light chains Tx: Chemotherapy, poor prognosis though 😞	
Leukemia	= Neoplasm of bone marrow cells (Lymphocytes, NK cells, Granulocytes and megakaryocytes) Classification based on cell lineage (myeloid or lymphoid) and acute vs chronic: <ul style="list-style-type: none"> - ALL -> CML -> AML -> CLL ^In order of age prevalence from young to old - "ALL Children Are ChiLL" ALL: Acute Lymphocytic Leukemia CML: Chronic Myelogenous Leukemia AML: Acute Myelogenous Leukemia CLL: Chronic Lymphocytic Leukemia Clinic Signs: <ul style="list-style-type: none"> - Bleeding (Platelets) - Fatigue (RBC) - Infection (WBC) *Even though we are seeing ↑ production of the bone marrow cells, they are immature and have less function*	

Odontogenic

Cysts

Radicular Cyst (Periapical Cyst)	<p>**Most common odontogenic Cyst**</p> <ul style="list-style-type: none"> - Epithelial Rests of Malassez (ERM) from the Hertwig's epithelial Root Sheath (HERS) within pocket of inflammation encapsulate the lesion -> forms cyst <p><u>Radiographically:</u></p> <ul style="list-style-type: none"> - RL around the apex of the root of a non-vital tooth <p>Necrotic pulp causes periapical inflammation</p> <ul style="list-style-type: none"> - Acute -> Abscess - Chronic -> Granuloma <p>Tx: RCT, Apicoectomy or Exo + curettage</p>	
Dentigerous Cyst (Eruption Cyst)	<p>*Accumulation of fluid between crown and Reduced Enamel Epithelium*</p> <p><u>Radiographically:</u></p> <ul style="list-style-type: none"> - RL attached to CEJ of impacted tooth <p>Most common w/ Canines and 3rd molars</p> <p>Tx: Excision -> but may be the source of future odontogenic tumors</p>	
Lateral Periodontal Cyst	<p>**Most common in mandibular premolar area*</p> <ul style="list-style-type: none"> - Always associated with vital tooth - Not centered around the apex 	
Gingival Cyst of the Adult	<p>**Soft tissue counterpart of the Lateral Periodontal Cyst**</p> <ul style="list-style-type: none"> - No RL in x-ray because not in the bone 	
Gingival Cyst of the Newborn	<p>*Rests of Dental Lamina epithelialize the small lesions*</p> <ul style="list-style-type: none"> - Bohn's Nodules = Lateral Palate - Epstein's Pearls = Midline palate <p>Tx: No tx, will involute as the children age</p>	
Primordial Cyst	<p>*Develops where a tooth would have formed but didn't*</p> <ul style="list-style-type: none"> - Most common at mandibular 3rd molar area <p>Tx: Complete Removal</p>	
Keratocystic Odontogenic Tumor (KCOT)	<p>**Aggressive and recurrent**</p> <ul style="list-style-type: none"> - Thin corrugated parakeratinized epithelium histologically - Fusiform, M-D expansion (not B-L), minimal displacement of teeth or resorption <p><u>Location:</u></p> <ul style="list-style-type: none"> - Commonly in Posterior ascending ramus of mand. <p>Associated Syndrome:</p> <ul style="list-style-type: none"> - Gorlin Syndrome (Nevoid Basal Cell Carcinoma, NBCC) = Multiple KCOT, Multiple BCC's, Calcified Falx Cerebri, Fatal disease <p>Tx: Aggressive enucleation</p>	
Calcifying Odontogenic Cyst (Gorlin Cyst)	<p>*Rare and unpredictable*</p> <p>Involves Ghost Cells:</p> <ul style="list-style-type: none"> - Empty spaces where nucleus was and is filled with keratin. Can undergo calcification w/ little radiodensities present in X-Ray 	

Tumors

Ameloblastoma	<p>**Benign, but very aggressive**</p> <p><u>Location:</u></p> <ul style="list-style-type: none"> - Posterior mandible <p><u>Radiographically:</u></p> <ul style="list-style-type: none"> - Multilocular expansive lesion (Beach ball B-L expansion) with erosion and displacement of roots and cortical bone <p><u>Tx:</u> Wide excision or resection, high recurrence if you are too conservative</p> <p><u>Ddx:</u></p> <ul style="list-style-type: none"> - Ameloblastoma, KCOT, CGCG, COF 	
Calcifying Epithelial Odontogenic Tumor (CEOT) (Pindborg Tumor)	<p><u>Radiographically:</u></p> <ul style="list-style-type: none"> - RL w/ driven snow calcifications (White flecks) <p><u>Histologically:</u></p> <ul style="list-style-type: none"> - Amorphous pink amyloid w/ concentric calcifications AKA Liesegang Rings <p><u>Tx:</u> Surgical excision w/ good prognosis</p>	
Adenomatoid Odontogenic Tumor (AOT)	<p>Contains epithelial duct-like spaces + enameloid material</p> <p><u>Location:</u></p> <ul style="list-style-type: none"> - Mostly Anterior maxilla over impacted canines <p><u>Tx:</u> Surgical excision w/ good prognosis</p>	
Odontogenic Myxoma (Myxofibroma)	<p>Myxomatous CT (pulp-like material w/ minimal collagen) -> Slimy Stroma</p> <p><u>Radiographically:</u></p> <ul style="list-style-type: none"> - Messy RL w/ unclear borders and honeycomb/tennis racket pattern <p><u>Tx:</u> Surgical Excision w/ moderate recurrence</p>	
Central Odontogenic Fibroma (COF)	<p>= Dense collagen w/ strands of epithelial woven within it</p> <p><u>2 forms:</u></p> <ul style="list-style-type: none"> - Central = Occurs within bone, well defined multilocular RL - Peripheral = occurs in the gingiva (will not see in radiograph) 	
Cementoblastoma	<p>= Well circumscribed RO mass</p> <ul style="list-style-type: none"> - Ball of cementum + Cementoblasts that replace the tooth root - Connected to the root (surrounded by a PDL space) <p><u>Tx:</u> Surgical excision and Exo</p>	
Ameloblastic Fibroma	<p>**Occurs mostly in children and teens**</p> <p><u>Location:</u></p> <ul style="list-style-type: none"> - Posterior Mandible <p><u>Contents:</u></p> <ul style="list-style-type: none"> - Myxomatous CT <p><u>Tx:</u></p> <ul style="list-style-type: none"> - Surgical Excision 	
Odontoma	<p>= Opaque lesion composed of dental hard tissues</p> <ul style="list-style-type: none"> - Can block eruption of teeth <p>Compound = Mostly anterior, "Bag of teeth"</p> <p>Complex = Mostly Posterior, conglomerate mass of dental tissue</p> <p>Associated Syndromes:</p> <ul style="list-style-type: none"> - Gardner Syndrome = Multiple odontomas + Intestinal Polyps 	

Bone Lesions

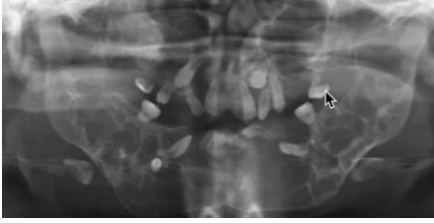

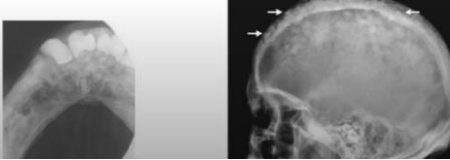

Fibro-Osseous Lesions

- Typically, more radiopaque, as these lesions are osseous

Central Ossifying Fibroma	<p>= Fibroblastic stroma in which foci of mineralized products are formed</p> <ul style="list-style-type: none"> - Similar in appearance and behaviour to cementifying fibroma (odontogenic tumor) <p>3 Types:</p> <ul style="list-style-type: none"> - Central = in bone. Well circumscribed radiolucency with ossification product in the center - Peripheral = in soft tissue, so you don't see the iconic radiographic appearance - Juvenile = Aggressive variant, rapid growth, younger patients <p>Tx: Surgical Excision</p>	
Fibrous Dysplasia	<p>**Ground Glass Appearance**</p> <ul style="list-style-type: none"> - "Fiberglass -> "Fibrous + Glass" (memory trick) - Usually stops growing after puberty -> but until then it can grow lots and cause major issues <p>Associated Syndrome:</p> <ul style="list-style-type: none"> - <u>McCune-Albright Syndrome</u> = Polyostotic (more than 1 bone) fibrous dysplasia + Cutaneous café au lait spots + endocrine abnormalities <p>Tx: Surgical recontouring for cosmetics (typically after puberty)</p>	
Periapical Cemento-Osseous Dysplasia (PCOD)	<p>= Reactive process of unknown origin</p> <ul style="list-style-type: none"> - Most common at apices of mandibular anteriors - Most common in middle-aged black females - Teeth are vital - Starts RL -> Progresses to RO (with RL halo) as the lesion matures <p>Tx: None</p>	
Osteoblastoma	<p>Circumscribed Opaque mass of bone and osteoblasts</p> <p>Tx: Surgical Excision</p>	

Giant Cell Lesions

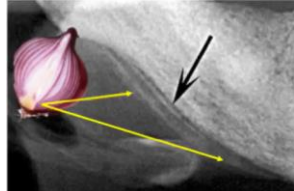

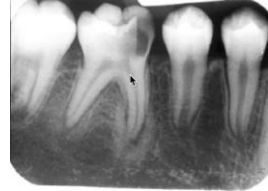

Central Giant Cell Granuloma (CGCG)	<p><u>Composition:</u></p> <ul style="list-style-type: none"> - Fibroblasts and multinucleated giant cells <p><u>Location:</u></p> <ul style="list-style-type: none"> - Anterior mandible mostly <p><u>Types:</u></p> <ul style="list-style-type: none"> - Central (CGCG): in Bone, RL lesion with thin wispy septations - Peripheral: In Soft tissue, Red-purple gingival mass <p>Tx: Excision</p>	
Aneurysmal Bone Cyst	<p>*Pseudocyst composed of blood-filled spaces*</p> <ul style="list-style-type: none"> - Fine needle Aspirational Biopsy is what you need to do to determine the Dx <p><u>Radiographic:</u></p> <ul style="list-style-type: none"> - Multilocular RL - Expansile <p><u>Location:</u></p> <ul style="list-style-type: none"> - Posterior mandible favored <p>Tx: Excision</p>	

Hyperparathyroidism	<p>Causes multiple bone lesions that mask as CGCG's as a result of ↑ parathyroid hormone</p> <p>Brown Tumor -> Forms due to excess osteoclast activity</p> <ul style="list-style-type: none"> - This ↑ OC activity ↑ the amount of alkaline phosphatase <p>Associated Syndrome:</p> <ul style="list-style-type: none"> - Von Recklinghausen's disease of bone = result of this condition (this is different from von Recklinghausen's disease/neurofibromatosis) 	
Cherubism	<p>Autosomal Dominant inheritance pattern</p> <p><u>Characteristic:</u></p> <ul style="list-style-type: none"> - Symmetrical bilateral swelling from expansile bilateral multilocular radiolucencies (fibrous dysplasia in contrast is asymmetric and unilateral) - Stops growing after puberty 	
Langerhans Cell Disease (Idiopathic Histiocytosis)	<p>Rare type of cancer</p> <ul style="list-style-type: none"> - Langerhans cells (Histiocytes) normally found in skin as an antigen presenting cells -> can cause damage if they build up in the body <p><u>Radiographic:</u></p> <ul style="list-style-type: none"> - Punched out "ice cream scoop" radiolucencies that lead to floating teeth <p>Tx: Excision, radiation and chemo</p>	
Paget's Disease	<p>= Progressive metabolic disturbance of many bones (spine, femur, skull, jaws) -> causes symmetrical enlargement</p> <ul style="list-style-type: none"> - Usually in adults > 50 years - Elevated alkaline phosphatase is found b/c of ↑ bone breakdown - As bone expands, dentures and hats become too tight - Associated with Hypercementosis <p><u>Characteristic:</u></p> <ul style="list-style-type: none"> - Cotton wool appearance <p>Tx: Bisphosphonates and Calcitonin</p>	

Inflammatory

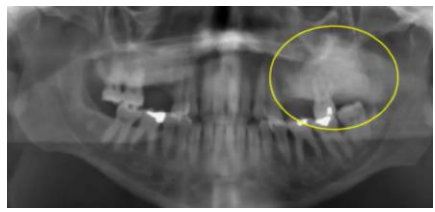

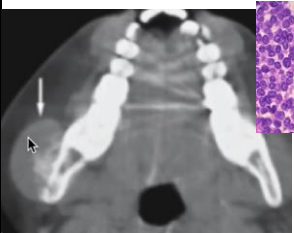

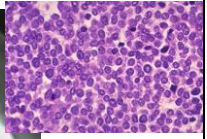

- Most lesions are an extension of either periodontal or periapical inflammation, or trauma

Acute Osteomyelitis	<p><u>Causes:</u></p> <ul style="list-style-type: none"> - Odontogenic infection - Trauma <p>Infection/inflammation usually begins the medullary space involving the cancellous bone AND spreads to the cortical bone, periosteum, and soft tissues</p> <p><u>Symptoms:</u></p> <ul style="list-style-type: none"> - Deep and intense pain - High or intermittent fever - Paresthesia or anesthesia of the IAN - Tooth is NOT loose (this is caused periodontitis) <p>Tx: Antibiotics</p>	 <p>Yes...this is osteomyelitis in a dog, but it's good picture of it</p>
----------------------------	---	--

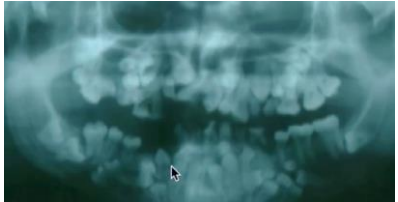

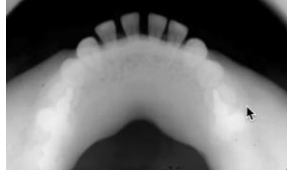

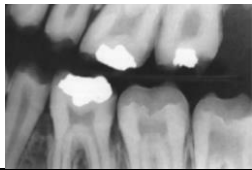

Chronic Osteomyelitis	<p>*Diffuse mottled radiolucency*</p> <p>Garre's Osteomyelitis = Chronic osteomyelitis w/ proliferative periosteitis (onion skin)</p> <p>Tx: Antibiotics + debridement of infected area</p>	
Focal Sclerosing Osteomyelitis (Condensing Osteitis)	<p>= Bone sclerosis resulting from low-grade inflammation (like chronic pulpitis)</p> <p>Tx: None, address the cause of inflammation</p> <p>Diffuse Sclerosing Osteomyelitis:</p> <ul style="list-style-type: none"> - Same as focal, but wider scale that may lead to jaw fracture 	
Bisphosphonate-Related Osteonecrosis of the Jaws (BRONJ)	<p>**IV bisphosphonates ↑ risk vs oral**</p> <ul style="list-style-type: none"> - Jaw Pain - Exposed necrotic bone <p>Tx: CHX rinse, antibiotics, conservative surgery</p>	

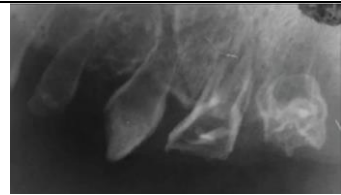

Malignant Lesions

- Numb lip/paresthesia is the most common symptom associated with malignancy

Osteosarcoma	<p>= Sarcoma of the jaw where new bone is produced by tumor cells</p> <ul style="list-style-type: none"> - 5-year survival is 25-40% (Pretty deadly) <p><u>Radiographic:</u></p> <ul style="list-style-type: none"> - Sunburst pattern of radiopacity <p>Tx: Resection and chemotherapy</p>	
Chondrosarcoma	<p>= Sarcoma of the jaws where new cartilage is produced by tumor cells</p> <ul style="list-style-type: none"> - Same presentation and Tx as the Osteosarcoma <p><u>Location:</u></p> <ul style="list-style-type: none"> - More common involving the condyle b/c of its separate cartilaginous origin vs the rest of the jaw 	
Ewing's Sarcoma	<p>= Sarcoma of the long bones involving "round cells"</p> <ul style="list-style-type: none"> - Seldom affects the jaws (because long bones) - Affects children mostly - Involves swelling 	 
Metastatic Carcinoma	<ul style="list-style-type: none"> - Pain, swelling and especially paresthesia - Posterior Mandible - Ill defined changes are noted <p>Originated somewhere else and metastasized to the jaw:</p> <ul style="list-style-type: none"> - Breast > Lung > Kidney > Colon > Prostate 	

Hereditary Conditions

White Sponge Nevus	<p>Asymptomatic spongy white lesion on the buccal mucosa -> DOESN'T wipe off</p> <ul style="list-style-type: none"> - Autosomal dominant inheritance 	
Epidermolysis Bullosa	<p>Skin and mucosa is fragile and blisters easily</p> <ul style="list-style-type: none"> - Widespread blistering 	
Hereditary Hemorrhagic Telangiectasia (HHT)	<p>AKA Osler-Weber-Rendu Syndrome</p> <ul style="list-style-type: none"> - Abnormal capillary formation on skin, mucosa, and viscera - Associated w/ iron-deficiency anemia - Epistaxis (nose bleeds) is a frequent presenting sign <p>Telangiectasia = red macule or papule from dilated or broken capillaries</p>	
Cleidocranial Dysplasia (always on NDBE)	<ul style="list-style-type: none"> - Autosomal Dominant <p>Common sign:</p> <ul style="list-style-type: none"> - Missing/poorly developed clavicles -> Shoulders appear hunched in towards the midline - Supernumerary teeth <p>Tx:</p> <ul style="list-style-type: none"> - Typically lots of exo's and the dentures 	
Ectodermal Dysplasia (Also always tested)	<ul style="list-style-type: none"> - X-linked recessive <p>Common Signs:</p> <ul style="list-style-type: none"> - Missing teeth - Hypoplastic hair or nails 	
Osteopetrosis	<p>AKA Albers-Schonberg disease or Marble bone disease</p> <ul style="list-style-type: none"> - Stone Bone -> lack of remodelling and resorption 	
Amelogenesis Imperfecta	<p>= Intrinsic alteration of the ENAMEL (dentin and pulp are normal) in both the primary and permanent teeth</p> <ul style="list-style-type: none"> - Autosomal dominant, recessive or x-linked inheritance <p>Tx: Full-coverage crowns for cosmetics</p>	
Dentinogenesis Imperfecta	<p>= intrinsic alteration of DENTIN affecting both primary and permanent teeth</p> <ul style="list-style-type: none"> - Autosomal dominant inheritance <p>Characteristics:</p> <ul style="list-style-type: none"> - Short roots, bell-shaped crowns and obliterated pulps - Bulbous crowns in radiographs (b/c constricted DEJ) - Blue sclera <p>Tx: Full coverage crowns</p>	

Dentin Dysplasia	<p>= Intrinsic alteration of dentin affecting primary and permanent teeth</p> <ul style="list-style-type: none"> - Autosomal dominants - Two Types (Type 1 and Type 2) <p>Characteristics:</p> <ul style="list-style-type: none"> - Chevron pulps and short roots <p>**Not good candidates for restoration (short root = poor C;R ratio; Chevron pulps ↑ risk of pulp exposure)</p>	
Regional Odontodysplasia	<p>= Quadrant of teeth exhibit short roots, open apices, and enlarged pulp chambers</p> <p><u>Radiographic:</u></p> <ul style="list-style-type: none"> - Ghost teeth -> Pulpals are so huge they make the teeth look almost completed RL (common NDBE term) <p>Tx:</p> <ul style="list-style-type: none"> - Extract affected teeth 	
Fusion and Gerniation	<p><u>Fusion</u></p> <p>2 Tooth buds merging into 1 tooth</p> <ul style="list-style-type: none"> - Tooth count is 1 less than the normal <p><u>Gerniation</u></p> <p>1 root buds into 2 crowns</p> <ul style="list-style-type: none"> - Tooth count is normal
